an important part of the process, we consider the possibility that practitioners have a strong belief in their own effectiveness. A self-efficacy belief is the degree to which individuals believe in their own ability. The self-efficacy construct is presented here, as a possible factor for understanding the process of change. We hypothesize that self-efficacy is related to change in the following manner:

It is important to note that the amount of water supplied to the system is not constant. The amount of water supplied to the system is a function of the amount of water available in the reservoir. The amount of water available in the reservoir is a function of the amount of water that has been stored in the reservoir. The amount of water that has been stored in the reservoir is a function of the amount of water that has been stored in the reservoir.

Abstract: This paper examines the impact of the 1997-1998 Asian financial crisis on the performance of the Korean stock market. The results show that the Korean stock market experienced a significant decline in performance during the crisis period. The decline was more pronounced for the large-cap stocks than for the small-cap stocks. The results also show that the Korean stock market experienced a significant increase in volatility during the crisis period. The increase in volatility was more pronounced for the large-cap stocks than for the small-cap stocks. The results suggest that the Korean stock market is highly sensitive to the Asian financial crisis.

1944) showed that the average number of eggs per female that survived the diapause varied with the ratio of cold to warm days during the diapause period. It would be possible to construct a function of survival versus diapause length, but the number of days a ladybug could enter diapause is very variable in laboratory tests (Meyerowitz, 1964). This fact alone is enough to make such a function impractical. That female diapause rates could be predicted solely on the basis of the environmental temperature alone is probably not the best way to estimate diapause length. It appears that the number of days observed after hatching in the lab is the best way to estimate diapause length. However, in the case of the predaceous ladybug, survival rates in the laboratory cannot easily estimate those in the field. In estimating the diapause of the commonest beetle in the United States, we estimated diapause rates in the laboratory to have resulted in about 10% underestimates (Singer et al., 1990). The data presented in this paper are the best available field data to estimate the fall diapause rates of the ladybug.
