Plant Response to Gold Nanoparticles Azamal Husen, 2024-12-01 In this book overall plant and soil system are examined exclusively in terms of gold nanoparticles Au NPs exposure Au NPs influence plant growth and yield performance They also affect plant and soil system interactions Au NPs responses are primarily depends on the concentration plant species or cultivars exposure time shape and size of NPs Investigation have shown that the lower concentrations of Au NPs increase seed germination beneficial biochemical components rate of photosynthesis and overall growth however at higher concentrations all these responses are declined in different plant species At higher concentration Au NPs induce stress in plant create phytotoxicity and produce reactive oxygen species which leads to the disruption of cellular metabolism Further at higher concentration Au NPs hampered the physico chemical process of plant and soil system Moreover the molecular and physiological performance showed that the exposure of Au NPs resulted in oxidative stress and induced antioxidative and defense responses The energy production related to metabolic pathways were also influenced by Au NPs exposure Au NPs exposure accelerated the number of chromosomal aberrations micronuclei and decreased the mitotic index in plant root tip cells Proteomic study has shown that the exposure Au NPs resulted in an accumulation of protein precursors indicative of the dissipation of a proton motive force Au ions were noticed in roots and shoots while Au NPs were absorbed only in the plant root tissues Au NPs exposure also influence flowering process and seed germination Beside the terrestrial plants these particles have also influenced the growth of some wetland and aquatic plants It was also noticed that the addition of Au NPs into the culture medium had also influence the in vitro development and multiplication of plants Studies have begun to examine how arbuscular mycorrhizal fungi might affect the uptake of specific nanoparticles include Au and how these particles might influence the plant mycorrhizal relationships The impact of Au NPs on the size and structure of microbial communities in soil and soil enzymatic activities for glucosidase urease alkaline phosphatase and dehydrogenase has been examined In the present book environmental safety and ethical issues related to use of Au NPs in plant and soil system has been also explored Overall this book is provide an up to date most important and selected information associated with the plant response to Au NPs This book will be a good resource for upper level students faculty scientists and researchers working specially on plant biology plant nanobiotechnology plant biochemistry plant microbiology agricultural and other allied subjects and or science

Plant Responses to Hypoxia Elena Loreti, Gustavo Striker, 2021-03-02 Molecular oxygen deficiency leads to altered cellular metabolism and can dramatically reduce crop productivity Nearly all crops are negatively affected by a lack of oxygen hypoxia due to adverse environmental conditions such as excessive rain and soil waterlogging Extensive efforts to fully understand how plants sense oxygen deficiency and their ability to respond using different strategies are crucial to increase hypoxia tolerance Progress in our understanding has been significant in recent years This topic certainly deserves more attention from the academic community therefore we have compiled a series of articles

reflecting the advancements made thus far Plant Adaptation and Crop Improvement Mark Cooper, Graeme L. Hammer, 1996 An overview of crop improvement Analysis of genotype by environment interactions Interpretation of genotype by environment interactions Integrated approaches to plant improvement Synthesis of strategies for crop improvement

Plants' Responses to Novel Environmental Pressures Alessio Fini, Massimiliano Tattini, Raquel Esteban, 2018-02-01 Plants have been exposed to multiple environmental stressors on long term seasonal and short term daily basis since their appearance on land However the frequency and the intensity of stress events have increased much during the last three decades because of climate change Plants have developed however a multiplicity of modular and highly integrated strategies to cope with challenges imposed by novel usually harsher environments These strategies include migration acclimation and adaptation Twelve articles in this research topic exactly focus on the relative significance of these response mechanisms for the successful acclimation of plants to a wide range of novel environmental pressures Four articles additionally explore how plants respond to severe stress conditions resulting from the concurrent action of multiple stressors Ten articles mostly examine how morpho anatomical physiological and biochemical related traits integrate when plants suffer from novel threats such as solid gaseous and electromagnetic pollutants Suitable physiological indicators for developing conservation strategies are described in the last two works This research topic highlights that bottom up as well as top down approaches will be necessary to develop in near future in the study of plants responses to environmental pressures

Environmental Pollution and Plant Responses Shashi Bhushan Agrawal, Madhoolika Agrawal, 2023-01-30 Comprehensive and global in scope Environmental Pollution and Plant Responses provides an analysis of the research on the factors contributing to the deteriorating environmental quality and its effect on plant performance The issues include environmental pollution and global climate change response patterns of plants at different levels mechanisms of interaction tolerance strategies and future research prospects The author evaluates trends and gives management strategies for abating the problem This volume highlights the complexities of environmental problems and the affect of pollution on every level of the ecosystem

Interplay between NO Signalling, ROS and the Antioxidant System in Plants Jeremy Astier, Gary Loake, Violeta Velikova, Frank Gaupels, 2017-01-19 Over the last decades nitric oxide NO has emerged as an essential player in redox signalling Reactive oxygen species ROS also act as signals throughout all stages of plant life Because they are potentially harmful for cellular integrity ROS and NO levels must be tightly controlled especially by the classical antioxidant system and additional redox active metabolites and proteins Recent work provided evidence that NO and ROS influence each other's biosynthesis and removal Moreover novel signalling

molecules resulting from the chemical reaction between NO ROS and plant metabolites have been highlighted including N₂O₃ ONOO NO₂ S nitrosoglutathione and 8 NO₂ cGMP They are involved in diverse plant physiological processes the best characterized being stomata regulation and stress defense Taken together these new data demonstrate the complex interactions between NO ROS signalling and the antioxidant system This Frontiers in Plant Science Research Topic aims to provide an updated and complete overview of this important and rapidly expanding area through original article and detailed reviews

Crop Response to Density: Optimization of Resource Use to Promote Sustainability Yared Assefa, Ioannis Tokatlidis, Yashvir Chauhan, 2022-09-14

Biotic Stress and Yield Loss Robert K.D. Peterson, Leon G. Higley, 2000-12-28 Understanding biotic stress and plant yield allows for the practical development of economic decision making an instrumental part of Integrated Pest Management And further the impact of biotic injury on plant yield bears directly on the basic biological questions of population dynamics life history strategies community structure plant stress

Handbook of Plant and Crop Stress, Second Edition Mohammad Pessarakli, 1999-05-19 Detailing interrelated topics this work addresses issues and concerns related to plant and crop stress This edition includes information on pH stress temperature stress water deficit conditions carotenoids and stress light stress pollution stress agrichemical stress oxidative damage to proteins UV B induced stress and abiotic stress tolerance

Plant-pathogen Interactions Nicholas J. Talbot, 2004 Plant diseases are destructive and threaten virtually any crop grown on a commercial scale They are kept in check by plant breeding strategies that have introgressed disease resistance genes into many important crops and by the deployment of costly control measures such as antibiotics and fungicides However the capacity for the agents of plant disease viruses bacteria fungi and oomycetes to adapt to new conditions overcoming disease resistance and becoming resistant to pesticides is very great For these reasons understanding the biology of plant diseases is essential for the development of durable control strategies Plant Pathogen Interactions provides an overview of our current knowledge of plant pathogen interactions and the establishment of plant disease drawing together fundamental new information on plant infection mechanisms and host responses The role of molecular signals gene regulation and the physiology of pathogenic organisms are emphasized but the role of the prevailing environment in the conditioning of disease is also discussed Emphasizing the broader understanding that has emerged from the use of molecular genetics and genomics Plant Pathogen Interactions highlights those interactions that have been most widely studied and those in which genome information has provided a new level of understanding

Compatible Solutes Engineering for Crop Plants Facing Climate Change Shabir Hussain Wani, Manu Pratap Gangola, Bharathi Raja Ramadoss, 2021-10-30 Plants being sessile and autotrophic in nature must cope with challenging environmental aberrations and therefore have evolved various responsive or defensive mechanisms including stress sensing mechanisms antioxidant system signaling pathways secondary metabolites biosynthesis and other defensive pathways among which accumulation of osmolytes or osmo protectants is an important phenomenon Osmolytes

with organic chemical nature termed as compatible solutes are highly soluble compounds with no net charge at physiological pH and nontoxic at higher concentrations to plant cells. Compatible solutes in plants involve compounds like proline, glycine betaine, polyamines, trehalose, raffinose, family oligosaccharides, fructans, gamma aminobutyric acid (GABA) and sugar alcohols playing structural, physiological, biochemical and signaling roles during normal plant growth and development. The current and sustaining problems of climate change and increasing world population has challenged global food security. To feed more than 9 billion the estimated population by 2050, the yield of major crops needs to be increased 1.1–1.3% per year, which is mainly restricted by the yield ceiling. A major factor limiting the crop yield is the changing global environmental conditions which includes drought, salinity and extreme temperatures and are responsible for a reduction of crop yield in almost all the crop plants. This condition may worsen with a decrease in agricultural land or the loss of potential crop yields by 70%. Therefore, it is a challenging task for agricultural scientists to develop tolerant resistant varieties against abiotic stresses. The development of stress tolerant plant varieties through conventional breeding is very slow due to complex multigene traits. Engineering compatible solutes biosynthesis by deciphering the mechanism behind the abiotic tolerance or accumulation in plants cell is a potential emerging strategy to mitigate adverse effects of abiotic stresses and increase global crop production. However, detailed information on compatible solutes including their sensing, signaling, biosynthesis, regulatory components underlying biochemical mechanisms, crosstalk with other signaling pathways and transgenic development have not been compiled into a single resource. Our book intends to fill this unmet need with insight from recent advances in compatible solutes research on agriculturally important crop plants.

Relationship between Forest Ecophysiology and Environment Roberto Tognetti, John D. Marshall, 2021-06-04 Ecophysiological mechanisms underlie plant responses to environmental conditions and the influence these responses have on ecological patterns and processes. In this Special Issue with a particular interest in the interactions between climate change, environmental disturbance and functional ecology, experimental observations are described at a range of spatial scales. A modeling framework is used in an effort to relate mechanistic responses to ecosystem functions and services and link forest ecophysiology and environmental indicators. This Special Issue collects important advances in studying and monitoring plant-environment interactions covering biogeographic gradients from Mediterranean woodlands to boreal forests and from Alpine mountains to tropical environments.

Plant-Environment Interactions František Baluška, 2009-03-03 Our image of plants is changing dramatically away from passive entities merely subject to environmental forces and organisms that are designed solely for the accumulation of photosynthate. Plants are revealing themselves to be dynamic and highly sensitive organisms that actively and competitively forage for limited resources both above and below ground. Organisms that accurately gauge their circumstances use sophisticated cost-benefit analysis and take clear actions to mitigate and control diverse environmental threats. Moreover, plants are also capable of complex recognition of self and non-self and are territorial in behavior. They are as sophisticated in

behavior as animals but their potential has been masked because it operates on time scales many orders of magnitude less than those of animals. Plants are sessile organisms. As such, the only alternative to a rapidly changing environment is rapid adaptation. This book will focus on all these new and exciting aspects of plant biology. **Trace Gas Emissions and Plants** S.N. Singh, 2013-03-09 Atmospheric abundance of trace gases since the pre-industrial time has forced the earth's climate to change, threatening food security. Exchange of biogenic trace gases between the atmosphere and the biosphere is directly or indirectly influenced by the plants. This volume contains the latest findings on the correlation between the climate change and biogenic gas emission, plant response to elevated levels of carbon dioxide, temperature, ozone, and UV B, in combination and alone, regulatory mechanism of methane, nitrous oxide, and ammonia emission, and their mitigating options. Ecologists, atmospheric scientists, plant physiologists, research scholars, teachers, and post-graduate students will benefit from this book.
