Instead of teaching you the principles and practices of programming as a whole, this application-oriented text focuses on only what you need to know to research and answer social science questions. The text features two types of examples: one set from the General Social Survey and one set from a large taxi trip dataset from a major metropolitan area to help readers understand the possibilities of working with Python. Chapters on installing and working within a programming environment, basic skills, and necessary commands will get you up and running quickly, while chapters on programming logic, data input and output, and data frames help you establish the basic framework for conducting analyses. Further chapters on web scraping, statistical analysis, machine learning, and data visualization help you apply your skills to your research. More advanced information on developing graphical user interfaces (GUIs) helps you create functional data products using Python to inform general users of data who don't work within Python. First there was IBM SPSS, then there was R, and now there's Python. Statistical software is getting more aggressive, let authors Frederick Kaefer and Paul Kaefer help you tame it with *Introduction to Python Programming for Business and Social Science Applications*.
