

A Case Report of Disseminated Tuberculosis With an Atypical Presentation

Ratul Sarkar^a, Pratyay Hasan^{b, *}, Ahmedul Kabir^c

Abstract

Here we report a 45-year-old male who presented to us with fever, loss of appetite, and painless bilateral testicular swellings. His routine chest X-ray revealed reticulo-nodular opacities in both lung fields. Ultra-sonogram of both testes revealed multiple fairly large space occupying lesions in both testes and epididymides. Initially thought to be a case of testicular tumor with lung metastases, the case later proved to be a case of chronic disseminated tuberculosis (TB), following fine needle aspiration and cytology of both testicular swellings and lung lesions. His sputum smear also revealed acid fast bacilli (2+). Interestingly, this patient had fever, loss of appetite, and cough 2 years ago, but remained well without specific anti-tubercular therapy in the intervening period. This case illustrates that common diseases can present in confusing and atypical ways. This cloaked appearance can misguide us to make a wrong diagnosis. Especially in a TB endemic zone such as ours, TB should not be excluded from the list of differential diagnoses, and should be actively searched.

Keywords: Disseminated tuberculosis; Diagnostic dilemma; Atypical presentation

Introduction

The infamous reputation "captain of all these men of death", originally ascribed by Sir William Osler to pneumonia [1], has later been awarded to tuberculosis (TB) by many including clinicians to historians or even novelists [2-4]. TB has been a scourge of the humankind from time immemorial. Till date, no other disease in history matches the sheer magnitude of the misery inflicted by TB on the human race in terms of morbidity and mortality [5]. TB is caused by bacteria of the

Mycobacterium tuberculosis complex and usually affects the lungs, although other organs are involved in up to one-third of cases [6]. In order of frequency, the extra-pulmonary sites most commonly involved in TB are the lymph nodes, pleura, genitourinary tract, bones and joints, meninges, peritoneum and pericardium [6]. Disseminated TB refers to concurrent involvement of at least two non-contiguous organs of the body or involvement of the blood and bone marrow by TB process [7]. Disseminated TB is still uncommon, and unlike the rapid disseminating form, well known as miliary TB, chronic metastasizing form is less frequently recognized [8]. In healthy individuals, the dissemination is contained by a prompt immune response, particularly cell-mediated immunity and interferon gamma pathways, limiting the infection [9]. Therefore, clinical disseminated disease following primary or reactivation of established latent TB is more often in relatively or absolutely compromised hosts such as infants, patients with acquired immune deficiency syndrome (AIDS) or patients with latent infection placed on a tumor necrosis factor alpha blocker, compromising the regular immune surveillance [10-13]. Rarely, the dissemination occurs in healthy individuals with no known predisposing condition challenging our clinical suspicion to consider it as a differential diagnosis, and especially with very non-specific and atypical features, as is the case presented here.

Case Report

A 45-year-old Bengali male, day laborer, hailing from Satar-gul, Badga, Dhaka, presented to us with fever, loss of appetite and bilateral testicular swelling for 3 months. Fever was low-grade, intermittent associated with evening rise of temperature, night sweats, and chills and rigor. The highest recorded temperature was 100 °F. He had also lost his appetite during this course of time. Three months back, he had noticed swelling in his both testes, which were gradually increasing in size. The swellings were painless. On query, he mentioned occasional cough, but no sputum production and hemoptysis. He had no chest pain, respiratory distress, urinary problem, altered bowel habit, abdominal distension, abdominal pain, or joint pain, but he felt unusually fatigued, and at the time of admission, he was fatigued to such extent that he could not perform any heavy work. He had lost 15 kg of weight over the last 2 years. In fact, 2 years ago, he had suffered from fever, cough with purulent sputum production (but no hemoptysis), chest pain and loss
