

Network Viva Questions

1. Define-Superposition Theorem.

The superposition theorem states that for a linear system the response (voltage or current) in any branch of a bilateral **linear circuit** having more than one independent source equals the algebraic sum of the responses caused by each independent source acting alone, where all the other independent sources are replaced by their internal **impedances**.

2. Define-Thevenin's Theorem

Any combination of batteries and resistances with two terminals can be replaced by a single voltage source V_{th} and a single **series resistor** R_{th} . The value of V_{th} is the open circuit **voltage** at the terminals, and the value of R_{th} is V_{th} divided by the current with the terminals short circuited.

3. Define Reciprocity Theorem

It states that "In any branch of a network or circuit, the current due to a single source of voltage (V) in the network is equal to the current through that branch in which the source was originally placed when the source is again put in the branch in which the current was originally obtained."

4. Define Norton's Theorem

Any collection of batteries and resistances with two terminals is electrically equivalent to an ideal current source I_n in parallel with a single resistor R_{n0} . The value of R_{n0} is the same as that in the Thevenin equivalent and the current I_n can be found by dividing the open circuit voltage by R_{n0} .

5. What are the advantages of Laplace Transform in Electrical Circuits?

1. It converts time domain integro-differential equation into an algebraic equation of s (Laplace operator) domain.
2. It makes the solution easy and less time consuming.
3. In time domain analysis, we have to find the complementary function and the particular integral for complete solution. While in frequency domain the complete solution can be obtained in one operation.
4. Initial conditions are automatically considered in Laplace transform operation while they have to put separately in time domain approach.
