Analytical System Evaluation Routine is a computer code for solving the top event probability of a system fault tree It has the
capability for easy migration of individual basic event probabilities from a zero open_quotes scale close_quotes factor
completely subjective state to one in which the analyst has total knowledge completely stochastic about each basic event The
code implements a fuzzy algebra solution for subjective data a probabilistic solution for stochastic data and a hybrid
mathematics solution for data that are partly subjective and partly stochastic Events that are not completely subjective or
completely stochastic are hybrid events and are internally handled as such The stochastic and fuzzy ranges of uncertainty in
the top event probability are also computed for the analyst These are provided in the form of a fuzzy function for the
subjective uncertainty a probability density function PDF for the stochastic variability and the overall open_quotes confidence
close_quotes factors for the two constituents of uncertainty giving a complete hybrid result PHASER interfaces with other
Sandia codes SABLE LHS and LHSPOST to assist the user in determining cutsets and to compute probability density
