

PHET Magnetism - Lab Guide

Part 1

Today you will be exploring magnets and electromagnets through a simulation provided by the University of Colorado at Boulder.

1. Click "understanding" under "questions" (see: "Magnetism and Electromagnetism." Below the title: "Magnetism and Electromagnetism" is underlined in blue).

2. Move the compass slowly along a circle around the bar magnet until you reach the other opposite labeled surface magnet. Observe what happens to the compass needle.

The compass has the ability to give you information about direction. It is often used to indicate where geographic north is. There is true north and it is marked on the map. The compass points toward a point known as magnetic. This is called a magnetic pole.

3. When the bar magnet the compass needle starts off, what does the needle tell you?

It would be like the magnet attracts compass and is repels.

4. How is the strength of the force that the bar magnet exerts related?

It is approximately a perpendicular distance.

5. What are the relationships between the compass needle (magnetized) and a bar magnet (non-mag)?

We know that there is a force change, especially when we move closer to the magnet. Magnetism changes when we move closer to the magnet, especially when we move closer to the magnet.

6. Move the compass along a circular path around the bar magnet until you are back at the opposite side of the bar magnet. Observe what happens to the compass needle.

When we move the bar magnet, we know that the magnet is moving. It is not a bar magnet, but it is a bar magnet. It is not a bar magnet, but it is a bar magnet. It is not a bar magnet, but it is a bar magnet.

Brain-powered Science Thomas O'Brien, 2010 How can a long metal needle pass through a balloon without popping it How can water flow at very different rates through two identical funnels How can a stick placed on a table under several sheets of newspaper and extended over the edge of a table snap when quickly struck without lifting or tearing the paper Author Thomas O'Brien takes these and 30 more science inquiry activities to a higher level in this book for educators who love to surprise and challenge their students with unanticipated results Using experiments based on the science of a discrepant event an experiment or demonstration in which the outcome is not what students expect O'Brien shows how learners can be motivated to reconsider their preconceived notions and think more closely about what has actually occurred and the underlying scientific explanations What makes this volume more valuable than a mere activity book is the addition of a science education component to the extensive science content found in each activity Each discrepant event is shown to be analogous to a pedagogical principle Speaking directly to teachers O'Brien writes Your participation as teacher as learner experimenter rather than simply passive reader in these minds on activities will lead you to question and help you to revise your implicit assumptions about the nature of science teaching and learning At the same time you will develop expertise with activities that you can use with your own students The dual purpose activities thus allow you to unlock two doors with one key the doors to your own learning and to your students learning The detailed analogies between the activities and science learning make the book an ideal resource for middle and high school teachers science teacher educators and their preservice students and professional development specialists alike This thorough and thought provoking text includes more than 200 up to date internet resources as well as extensions to each of the physical science biology and chemistry activities bringing the total number of inquiry activities to nearly 120 Most important the author reminds teachers that the study of science is full of surprises and should be both meaningful and fun for students
