Multidimensional Signal and Color Image Processing Using Lattices Eric Dubois, 2019-04-29. An Innovative Approach to Multidimensional Signals and Systems Theory for Image and Video Processing. In this volume, Eric Dubois further develops the theory of multi-D signal processing wherein input and output are vector value signals. With this framework, he introduces the reader to crucial concepts in signal processing such as continuous and discrete domain signals and systems, discrete domain periodic signals, sampling and reconstruction, light and color, random field models, image representation, and more. While most treatments use normalized representations for non-rectangular sampling, this approach obscures much of the geometrical and scale information of the signal. In contrast, Dr. Dubois uses actual units of space, time, and frequency. Basis-independent representations appear as much as possible, and the basis is introduced where needed to perform calculations or implementations. Thus, lattice theory is developed from the beginning, and rectangular sampling is treated as a special case. This is especially significant in the treatment of color and color image processing and for discrete transform representations based on symmetry groups, including fast computational algorithms. Other features include an entire chapter on lattices giving the reader a thorough grounding in the use of lattices in signal processing, extensive treatment of lattices as used to describe discrete domain signals and signal periodicities, chapters on sampling and reconstruction, random field models, symmetry-invariant signals and systems, and multidimensional Fourier transformation properties. Supplemented throughout with MATLAB examples and accompanying downloadable source code, graduate and doctoral students as well as senior undergraduates and professionals working in signal processing or video image processing and imaging will appreciate this fresh approach to multidimensional signals and systems theory both as a thorough introduction to the subject and as inspiration for future research.

Sensor Signal and Information Processing II Wai Lok Woo, Bin Gao, 2020-12-29

In the current age of information explosion, newly

invented technological sensors and software are now tightly integrated with our everyday lives. Many sensor processing algorithms have incorporated some forms of computational intelligence as part of their core framework in problem solving. These algorithms have the capacity to generalize and discover knowledge for themselves and learn new information whenever unseen data are captured. The primary aim of sensor processing is to develop techniques to interpret, understand, and act on information contained in the data. The interest of this book is in developing intelligent signal processing in order to pave the way for smart sensors. This involves mathematical advancement of nonlinear signal processing theory and its applications that extend far beyond traditional techniques. It bridges the boundary between theory and application, developing novel theoretically inspired methodologies targeting both longstanding and emergent signal processing applications. The topic ranges from phishing detection to integration of terrestrial laser scanning and from fault diagnosis to bio-inspired filtering. The book will appeal to established practitioners along with researchers and students in the emerging field of smart sensors processing.
