Conservation, Biodiversity and International Law A. Gillespie, 2013-07-01 Humanity has been gambling for generations with the extent to which it can degrade nature and continue to prosper Now the environmental debt is being called in and the ability of international diplomacy and law government policy and political will to deal with the issues is being tested Conservation Biodiversity and International Law is a must read for any practitioner in the high stakes business of restoring our ability to live in harmony with the natural world that sustains us Alastair Morrison Department of Conservation New Zealand Biodiversity is the cornerstone of life our plants animals and ecosystems are essential for livelihoods and have shaped our culture and traditions around the world However our precious biodiversity is at risk as never before Global targets to reduce biodiversity loss have not been met and we continue to lose biodiversity at an unprecedented rate In fact we are currently in the middle of an extinction crisis and scientists have advised that one species from our planet is being lost every 38 minutes The nature of this crisis and the actions taken to address it are clearly and articulately put forward in this landmark book by Professor Al Gillespie This book is particularly useful in documenting the many policy and legal actions that have been taken to address these issues and how the application of these instruments can be improved Although focused on the law the book covers a range of disciplines including science philosophy and policy which lay the foundation for international law This book makes a major and highly valued contribution to the discipline of environmental law and policy and is an invaluable reference for policy makers practitioners and academic audiences David Sheppard CEO of the Secretariat of the Pacific Regional Environment Programme SPREP This book is written by a prominent and influential scholar who also has the benefit of first hand knowledge of practical working of environmental regimes having participated in several important negotiations Gillespie's monograph therefore stands out among other publications on the subject of conservation combining thoughtful and scholarly approach to issues raised with unparallel insights into the working of environmental law and the conservation of biodiversity The book is very original in its presentation of this subject especially

in the selection of topics and the approach which is not only legal but also scientific philosophical and political This book is evidence of the great erudition of the author not only in the field of conservation but also in international environmental law and general international law an example of which can be his analysis of the precautionary principle trade and a very complex issue of the exception for indigenous peoples and science Mention also must be made of his detailed approach to various multilateral treaty regimes such as Ramsar Convention and the World Heritage Convention Gillespie wrote an exceptional book which is a must for international layers both practitioners and scholars It is a thought provoking very well researched and original monograph which due to its all encompassing approach will retain its importance for a very long period of time Malgosia Fitzmaurice Queen Mary University of London UK A major work this book provides a comprehensive picture of the international legal challenges of natural heritage conservation Truly an indispensable tool for policy makers experts and students The book offers a complete guide to the complex world of treaties that regulate conservation at the global scale Francesco Bandarin UNESCO Assistant Director General for Culture This important and timely book provides a rigorous overview of the defining issues presently facing conservation at international level The author provides detailed coverage of topics ranging from the classification of species right through to access and benefit sharing drawing on his personal experience at intergovernmental level Each question is examined through the prism of dozens of treaties and hundreds of decisions and resolutions of the key multilateral regimes and the law in each area is supplemented by the necessary considerations of science politics and philosophy providing much needed context for the reader Combining expert scholarship and first hand insight Conservation Biodiversity and International Law will be an invaluable resource for researchers and practitioners in international environmental law as well as providing an accessible guide for students

Resources in Education ,1984 *Cumulated Index Medicus* ,1986 *The Spirit in the Gene* Reg Morrison,1999 From famines and deforestation to water pollution global warming and the rapid rate of extinction of plants and animals the extent of the global damage wrought by humankind is staggering Why have we allowed our environment to reach such a crisis What produced the catastrophic population explosion that so taxes the earth's resources Reg Morrison's search for answers led him to ponder our species astonishing evolutionary success His extraordinary book describes how a spiritual outlook combined with a capacity for rational thought have enabled Homo sapiens to prosper through the millennia It convincingly depicts these traits as part of our genetic makeup and as the likely cause of our ultimate downfall against the inexorable laws of nature The book will change the way readers think about human evolution and the fate of our species Small bands of apes walked erect on the dangerous plains of East Africa several million years ago Morrison marvels that they not only survived but migrated to all corners of the earth and established civilizations To understand this feat he takes us back to a critical moment when these hominids developed language and with it the unique ability to think abstractly He shows how at this same time they began to derive increasing advantage from their growing sense of spirituality He convincingly depicts

spirituality as an evolutionary strategy that helped rescue our ancestors from extinction and drive the species toward global dominance Morrison concludes that this genetically productive spirituality which has influenced every aspect of our lives has led us to overpopulate the world and to devastate our own habitats Sobering sometimes chilling consistently fascinating his book offers a startling new view of human adaptation running its natural course [An Introduction to Global Environmental Issues](#) Lewis A. Expository Science: Forms and Functions of Popularisation T. Shinn, Richard P. Whitley, 1985-06-30 The prevailing view of scientific popularization both within academic circles and beyond affirms that its objectives and procedures are unrelated to tasks of cognitive development and that its pertinence is by and large restricted to the lay public Consistent with this view popularization is frequently portrayed as a logical and hence inescapable consequence of a culture dominated by science based products and procedures and by a scientific ideology On another level it is depicted as a quasi political device for channeling the energies of the general public along predetermined paths examples of this are the nineteenth century Industrial Revolution and the U S Soviet space race Alternatively scientific popularization is described as a carefully contrived plan which enables scientists or their spokesmen to allege that scientific learning is equitably shared by scientists and non scientists alike This manoeuvre is intended to weaken the claims of anti scientific protesters that scientists monopolize knowledge as a means of sustaining their social privileges Popularization is also sometimes presented as a psychological crutch This in an era of increasing scientific specialisation permits the researchers involved to believe that by transcending the boundaries of their narrow fields their endeavours assume a degree of general cognitive importance and even extra scientific relevance Regardless of the particular thrust of these different analyses it is important to point out that all are predicated on the tacit presupposition that scientific popularization belongs essentially to the realm of non science or only concerns the periphery of scientific activity

McElheny, 2009-03-25 The most influential scientist of the last century James Watson has been at dead center in the creation of modern molecular biology This masterful biography brings to life the extraordinary achievements not only of Watson but also all those working on this cutting edge of scientific discovery such as Walter Gilbert Francis Crick Francois Jacob and David Baltimore From the ruthless competition in the race to identify the structure of DNA to a near mutiny in the Harvard biology department to clashes with ethicists over issues in genetics Watson has left a wake of detractors as well as fans Victor McElheny probes brilliantly behind the veil of Watson's own invented persona bringing us close to the relentless genius and scientific impresario who triggered and sustained a revolution in science **Improving Nature?** Michael J. environmental laws and policies which are continually inviting failure as such laws can often be riddled with inconsistencies and be ultimately contradictory in purpose Specifically he seeks a nexus between the reasons why nations protect the environment how these reasons are reflected in law and policy and what complications arise from these choices This book takes account of the numerous developments in international environmental law and policy that have taken place the publication of the first edition most notably at the 2002 World Summit on Sustainable Development and the 2012 Rio 20 United Nations Conference on Sustainable Development Furthermore it addresses recent debates on the economic value of nature and the problems of the illegal trade in species and toxic waste The cultural context has also been considerably advanced in the areas of both intangible and tangible heritage with increasing attention being given to conservation wildlife management and the notion of protected areas The book investigates the ways in which progress has been made regarding humane trapping and killing of animals and how in contrast the Great Apes initiative and similar work with whales have failed Finally the book addresses the fact that while the notion of ecosystem management has been embraced by a number of environmental regimes it has thus far failed as an international philosophy
