Nitrogen Cycle Cut And Stick:

Cut-and-Paste Genetics Sahotra Sarkar, 2021-09-15 The emergence of CRISPR Cas9 technology has revolutionized gene editing The Nobel prize for chemistry was awarded to Emmanuelle Charpentier and Jennifer Doudna the scientists responsible for its discovery in 2020 and it is considered the frontier of sophisticated medical science This technology contains the promise that both gene therapy and eugenic control of human evolution is possible even plausible in our near future This book looks at these developments in the context of the history of previous social and scientific attempts at genetic editing and explores the policy and ethical challenges they raise It presents the case for altering the human germ line which contains and controls hereditary genetic information to eliminate a large number of genetic diseases controlled by a single or few genes while pointing out that gene therapy is likely to be ineffective for diseases with more complex causes In parallel it explores the possibility of genetic enhancement in a set of case studies But it also argues that in general genetic enhancement is ethically problematic and should be approached with caution Given the success of CRISPR Cas9 gene editing and the explosion of related techniques in practice it would be virtually impossible to ban germ line editing in our future A more useful goal is to put regulation in place with oversight that represents the interests of society That in turn requires an informed public discussion of these issues which is the intention of this book **The School Science Review** ,2000
