

CHAPTER 1 INTRODUCTION

1.0 Introduction

As a result of the tremendous growth of globalization, foreign language teachers now are operating in a multitude of countries, teaching language learners from diverse backgrounds (Li & Jin, 2020). Since English is currently the most important language in the world, there are many native English speaking teachers (NESTs) teaching English in other countries than their own native countries or non-native English speaking teachers (NNESTs). However, according to Hayes (2009), there are more than 63,000 of NNESTs teaching English to some 9.6 million students in Thailand.

Nowadays, parents encourage their children to learn English from an early age. Either by teaching their children at home, by playing English songs and videos for them, or by sending them to an international school or a school with an English curriculum, and due to tuition costs for native NESTs, the cost of these schools is much greater than typical Thai schools. In fact, there are many advantages of learning English with NNESTs. According to the research conducted by Walkinshaw and Oanh (2014) on native and non-native speaking teachers in Japan and Vietnam, NNESTs provided more efficient and effective instruction, better exam preparation, and much clearer explanations of problems in terms of grammar, exams, and problem-solving. However, Walkinshaw and Oanh conducted their research from the perspective of the students, not the parents, who are the ones who pay for the service. Students in middle and high school have more freedom to decide who they want to study with or where they want to study at. Meanwhile, for children ages 2 to 6, parents are the most influential and determine where their children will study.

For this study, the questionnaire will be conducted and given to 100 parents in Thailand especially, ones those who have toddlers (1-2 years old kids) or preschool age (3-6 years old). It is to see their satisfaction as a customer towards NNESTs (Thai teachers) in providing a service to their children as an English teacher in a preschool.

Design Charts for Open-channel Flow United States. Federal Highway Administration, 1979 The design of a highway drainage channel to carry a given discharge is accomplished in two parts The first part of the design involves the computation of a channel section which will carry the design discharge on the available slope This chapter briefly discusses the principles of flow in open channels and the use of the Manning equation for computing the channel capacity The second part of the design is the determination of the degree of protection required to prevent erosion in the drainage channel This can be done by computing the velocity in the channel at the design discharge using the Manning equation and comparing the calculated velocity with that permissible for the type of channel lining used A change in the type of channel lining will require a change in channel size unless both linings have the same roughness coefficient
