Objective Coefficient Sensitivity Report:

Strategic allocation of resources using linear programming model with parametric analysis: in MATLAB and Excel Solver Dinesh Gupta,2014-05-01 Since the late 1940s linear programming models have been used for many different purposes Airline companies apply these models to optimize their use of planes and staff NASA has been using them for years to optimize their use of limited resources Oil companies use them to optimize their refinery operations Small and medium sized businesses use linear programming to solve a huge variety of problems often involving resource allocation In my study a typical product mix problem in a manufacturing system producing two products each product consists of two sub assemblies is solved for its optimal solution through the use of the latest versions of MATLAB having the command `simlp` which is very much like `linprog` As analysts we try to find a good enough solution for the decision maker to make a final decision Our attempt is to give the mathematical description of the product mix optimization problem and bring the problem into a form ready to call MATLAB's `simlp` command The objective of this study is to find the best product mix that maximizes profit The graph obtained using MATLAB commands give the shaded area enclosed by the constraints called the feasible region which is the set of points satisfying all the constraints To find the optimal solution we look at the lines of equal profit to find the corner of the feasible region which yield the highest profit This corner can be found out at the farthest line of equal profit which still touches the feasible region The most critical part is the sensitivity analysis using Excel Solver and Parametric Analysis using computer software which allows us to study the effect on optimal solution due to discrete and continuous change in parameters of the LP model including to identify bottlenecks We have examined other options like product outsourcing one time cost cross training of one operator manufacturing of hypothetical third product on under utilized machines and optimal sequencing of jobs on machines
