

Questions about Exploratory Data Analysis

- 1) A scatter plot presents measurements of the same variable on both the horizontal and vertical axes.
- a) true
 - b) false

Explanation ... Scatter plots involve 2 distinct variables and present values of a different variable on each axis. Each point in a scatter plot thus represents the results of 2 measurements on one of the experimental subjects in the design, i.e., one measurement that appears on the Y axis and the other that appears on the X axis

- 2) To make a histogram from a series of observations, the variable involved must be ordinal or better (i.e., either ordinal, interval, or ratio)
- a) true
 - b) false

Explanation ... For a histogram to be successful, you must be able to establish equal-sized bins into which the observations can accumulate. But to say that the bins are equal in size is the same as saying that they occur at equally spaced intervals. The variable being measured must therefore cannot be ordinal since in ordinal there is not necessarily any sense of interval.

- 3) The mean is to the standard deviation as the median is to the _____
- a) interquartile range
 - b) semi-interquartile range
 - c) variance
 - d) range

Explanation ... The mean and standard deviation are often used to characterize data whose distribution is "well behaved" (i.e., no outliers, symmetric, unimodal). Under these circumstances the mean and standard deviation do a good job of characterizing the centre and dispersion of the distribution -- after all, in a Normal distribution the mean plus-or-minus one standard deviation encompasses a little more than half of all observations. On the other hand, when dealing with data whose distribution is full of outliers, not normally distributed, or nonsymmetric, people often resort to using the median and semi-interquartile range to describe the centre and dispersion of the data. In most distributions, the median plus-or-minus the semi-interquartile range encompasses half the observations.

- 4) An observation that is right in the middle of its distribution may appear as an outlier if you plot it in a scatterplot.
- a) true
 - b) false

Explanation ... Scatterplots show you the relationship between 2 variables. Suppose, then, that you measure the heights of all the people in an auditorium and found one person (participant "X") whose height is exactly in the middle of the height distribution. Suppose also that you assess the value of some psychological variable on the same people. If you now plot the psychological score versus height of all participants, it is possible that participant X will appear in
