

C1.1 Check and Reflect

- Hooke used a microscope with a compound, three-lens system, where the specimen was illuminated by a beam of light concentrated by passage through a water-filled disk. Van Leeuwenhoek used only a simple single-lens microscope, but produced higher magnification because of the quality of the lens. Hooke observed and recorded plants, animals, and non-living things. He described empty air pockets, which he called "cells" within thin slices of cork. He did not realize that the tiny chambers were the simplest units of life. Van Leeuwenhoek was able to observe bacteria, sperm, and protozoa (single cells) as free-living independent systems.
- Scientific inquiry involves a cause-and-effect question that leads to a hypothesis, and then experimentation to test the hypothesis. However, the scientist must first observe the system under study to know what questions to ask. Aristotle made careful observations and set up a classification system based on his observations, but did not have the technology to understand the building blocks of life. Hooke and van Leeuwenhoek used the microscope technology that they were developing to make observations on a scale that was previously impossible. Their methods were similar to modern scientific investigations in that they recorded their observations precisely, and made them available to others by publishing through the Royal Society of London.
- A simple microscope has one lens. A compound microscope has more than one lens.
- The field of view is the area that can be observed through a given lens.
- To calculate total magnification using a compound microscope, multiply the power of the objective lens by the power of the eyepiece. For example, when using a low-power $4\times$ objective lens and a $10\times$ eyepiece lens, the total magnification of the system is $40\times$.
- Use the conversion $1\text{ mm} = 1000\text{ }\mu\text{m}$.

$$\begin{aligned}\text{Therefore } \frac{x}{1000\text{ }\mu\text{m}} &= \frac{1.50\text{ mm}}{1.00\text{ mm}} \\ x &= \frac{1.50\text{ mm} \times 1000\text{ }\mu\text{m}}{1.00\text{ mm}} \\ &= 1500\text{ }\mu\text{m}\end{aligned}$$

- To calculate the diameter of the field of view using the $40\times$ objective, use the formula:

$$\frac{\text{high-power field diameter}}{\text{low-power field diameter}} = \frac{\text{low-power magnification}}{\text{high-power magnification}}$$

$$\frac{\text{high-power field diameter}}{1500\text{ }\mu\text{m}} = \frac{10\times}{40\times}$$

$$\begin{aligned}\text{high-power field diameter} &= \frac{(10\times)(1500\text{ }\mu\text{m})}{40\times} \\ &= 375\text{ }\mu\text{m}\end{aligned}$$

The field of view of the high-power objective has a diameter of $375\text{ }\mu\text{m}$.

- The measurement $2.5\text{ cm} = 25\text{ mm}$.
The scale of the drawing of an object that is $0.5\text{ mm} = 25.0 : 0.5$
 $= 50 : 1$
- Student answers will vary depending on their previous courses. They may include the points that convex lenses focus a beam of light to a common point, a compound microscope uses more than one convex lens, and the image formed is inverted when compared to the orientation of the object.

C1.2 Check and Reflect

- The improvements in lens technology that occurred in the 1830s allowed scientists to make more detailed observations of the structure of cells. This new technology made it possible for Brown to observe the nucleus in orchid cells. Schleiden observed that all plants are composed of cells and suggested that the nucleus is responsible for the development of the remainder of the cell. The microscope allowed Schwann to observe cells in animal tissue and to identify the nucleus in animal cells. These observations led to the idea that all plants and animals are made of cells, which are the basic units of life.
- Spontaneous generation is the idea that life could emerge spontaneously from non-living matter. This idea was widely accepted up until the middle of the 19th century. An example is that the maggots that appeared on rotting meat were thought to arise from the meat alone.
