

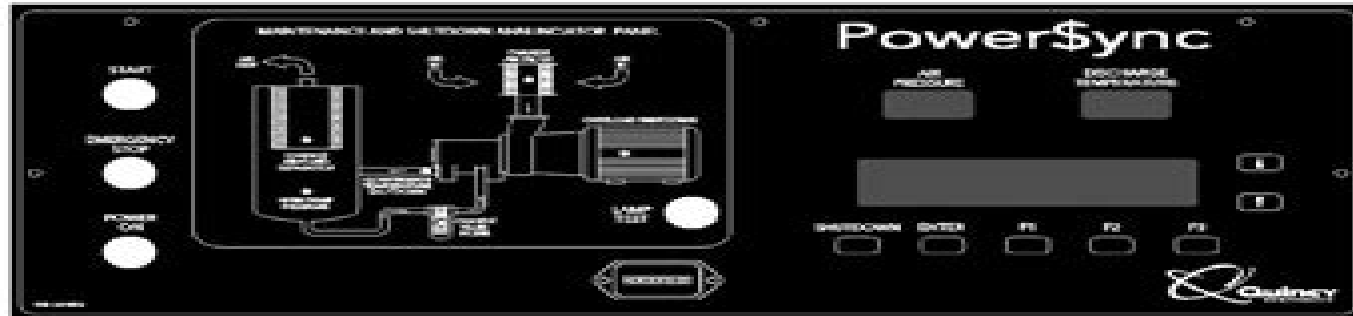

Figure 2. Computerized Control Panel

If a problem with the capacity control system is suspected, the Power\$ync software provides for testing these groups for proper operation. (Reference COMPRESSOR MAINTENANCE MENU 2 on page 41.)

NOTICE!

Troubleshooting the capacity control system can be done with the compressor to be tested supplying compressed air to the system *but* it is recommended that the compressor be isolated from the plant air system to avoid disruption of the air supply and variations in system pressure during testing.

The Power\$ync airend and controller have been designed to work together to provide the best full-load and part-load efficiencies available in the compressor industry.

Besides providing outstanding single machine efficiencies, Power\$ync includes multi-machine control that uses logic based on system and compressor capacity demands to provide optimal utilization of your compressor equipment.

For applications that may be able to use base-load compressors without variable capacity control, the computerized controller can be ordered with standard QSi or QS2 compressors and used in a network with other Power\$ync compressors.

NOTICE!

Reference 'Fluid Carryover' (pages 9-11) for special considerations when using the computerized controller with standard QSi compressors.
