Plant Systematics Michael George Simpson, 2010

Plant Systematics G Singh, 2016-04-19 The focus of the present edition has been to further consolidate the information on the principles of plant systematic include detailed discussion on all major systems of classification and significantly also include discussion on the selected families of vascular plants without sacrificing the discussion on basic principles The families included for discussion are largely those which have wide representation as also those that are less known but significant in evaluating the phylogeny of angiosperms

The discussion of the families also has a considerable focus on their phylogenetic relationships as evidenced by recent cladistic studies with liberal citation of molecular data. Several additional families have been included for detailed discussion in the present volume.

Accompany: 9780126444605. **Plant Taxonomy** Tod F. Stuessy, 2009. The field of plant taxonomy has transformed rapidly over the past fifteen years, especially with regard to improvements in cladistic analysis and the use of new molecular data. The second edition of this popular resource reflects these far-reaching and dramatic developments with more than 3,000 new references and many new figures. Synthesizing current research and trends, *Plant Taxonomy* now provides the most up-to-date overview in relation to monographic biodiversity and evolutionary studies and continues to be an essential resource for students and scholars. This text is divided into two parts. Part 1 explains the principles of taxonomy, including the importance of systematic characters, concepts of categories, and different approaches to biological classification. Part 2 outlines the different types of data used in plant taxonomic studies, with suggestions on their efficacy and modes of presentation and evaluation. This section also lists the equipment and financial resources required for gathering each type of data. References throughout the book illuminate the historical development of taxonomic terminology and philosophy, while citations offer further study. *Plant Taxonomy* is also a personal story of what it means to be a practicing taxonomist and to view these activities within a meaningful conceptual framework. Tod F. Stuessy recalls the progression of his own work and shares his belief that the most creative taxonomy is done by those who have a strong conceptual grasp of their own research.

Plant Systematics Walter S. Judd, 2008. A comprehensive introduction to vascular plant phylogeny, the third edition of *Plant Systematics* reflects changes in the circumscription of many orders and families to represent monophyletic groups following the most recent classification of the Angiosperm Phylogeny Group. Molecular taxonomic methods are fully presented, as are the results of many recent studies, both molecular and morphological.

Climate Change, Ecology and Systematics Trevor R. Hodgkinson, Michael B. Jones, Stephen Waldren, John A. N. Parnell, 2011-04-28. Climate change has shaped life in the past and will continue to do so in the future. Understanding the interactions between climate and biodiversity is a complex challenge to science. With contributions from 60 key researchers, this book examines the ongoing impact of climate change on the ecology and diversity of life on earth. It discusses the latest research within the fields of ecology and systematics, highlighting the increasing integration of their approaches and methods. Topics covered include the influence of climate change on evolutionary and ecological processes such as adaptation, migration, speciation, and extinction, and the role of these processes in determining the diversity and biogeographic distribution of species and their populations. This book ultimately illustrates the necessity for

global conservation actions to mitigate the effects of climate change in a world that is already undergoing a biodiversity crisis of unprecedented scale

Plant Resources for Food, Fuel and Conservation Robert James Henry, Dr Robert Henry, 2010 Agriculture and food production have a large footprint on the landscape globally and compete for space with land for nature conservation This book explores the competition between the food needs of a growing human population and the conservation of biodiversity as intensified by the emerging use of crops for energy production As concern about the impact of greenhouse gas emissions on climate grows and oil prices increase energy production from agricultural crops has become a significant industry At the same time growth in food demand due to population growth has been accelerated by growing affluence associated with economic growth in major developing countries increasing per capita consumption Consumers are concerned that the price of food will continue to increase sharply as a result of this competition but a loss of biodiversity may be another major outcome Drawing on his expertise in plant conservation genetics the author provides a balanced appraisal of the potential for developing new or improved crops for food or bioenergy production in the context of climate change while at the same time protecting biodiversity Back cover
