The Endangered Otter

Marine otter species are being lost at a rate that is unprecedented in the history of the otter. Otters are considered keystone species in their ecosystems. They play a critical role in maintaining the health of their ecosystems.

Marine otters are the only mammals that prey on sea urchins. Sea urchins are a major food source for many marine organisms. By eating sea urchins, otters help maintain the balance of the ecosystem. Without otters, sea urchin populations would increase, leading to the destruction of kelp forests. Kelp forests are important habitats for many marine species, and they also play a role in carbon sequestration and oxygen production.

Marine otters are also important for the health of the oceans. They help maintain the balance of the ecosystem by eating sea urchins. Without otters, sea urchin populations would increase, leading to the destruction of kelp forests. Kelp forests are important habitats for many marine species, and they also play a role in carbon sequestration and oxygen production.

Marine otters are also important for the health of the oceans. They help maintain the balance of the ecosystem by eating sea urchins. Without otters, sea urchin populations would increase, leading to the destruction of kelp forests. Kelp forests are important habitats for many marine species, and they also play a role in carbon sequestration and oxygen production.

Marine otters are also important for the health of the oceans. They help maintain the balance of the ecosystem by eating sea urchins.
