

instrument (L) with its three primary taps (M) for a primary voltage of 100, 115 or 125 volts, 60 cycles. A type 387-2 relay (N) is connected in series with the primary of the transformer. The secondary terminals (O) of the transformer are connected one to the common line of the instrument and the other to a terminal (P) which

connected to the end of a brass rod passing down through the brass plate (J), but insulated from it by a glass tube.

The brass plate (J) is supported later a clamp on the scale so that the height of this plate (J) above the pointer may be regulated and then held in place by the nut (H). A thumb screw (I) holds the clamp on the scale, the pointer (K) indicating the position and consequently the temperature at which the relay will trip.

The auxiliary relay is a type PQ-4Y relay, and is supplied for operating the alarm system when the indicating relay trips, and at the same time disconnecting the a-c. supply to the relay. The PQ-4Y relay is a hand-overriding device, thus enabling the attention of the operator to the abnormal change in temperature.

OPERATION.—The temperature indicator equipment operates on the principle of varying the ratio of the two currents in the differential winding of the DP Armored instrument. This is accomplished by having the resistance in series with the one winding with comparatively large positive temperature coefficient. The part of the resistance that has a temperature coefficient is located at the spot where it is desired to know the variations in temperature; a variation in temperature causes a variation in the value of the resistance, changing the ratio of the two currents in the differential winding, and the pointer of the indicating relay moves along the scale.

As the pointer of the relay moves up the scale it approaches the
