Refraction

Light refracts when passing between two substances at an angle.

Light does not bend as glass that is not yet within water. Bending begins at boundary between air and water.

SLAB

Light travels in a straight line through uniform medium. Refraction occurs at light's boundary with another medium.

The refractive index (n) of a substance is a ratio based on the speed of light.

SLAB

SLAB

At the light boundary, the angle of incidence is equal to the angle of refraction.

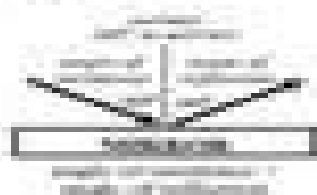

Reflection

Light reflects off a boundary between two media.

Normal - an imaginary line 90° perpendicular to a surface.

Angle of Incidence - the angle between the incident ray and normal.

Angle of Reflection - the angle between the reflected ray and the normal.

Focus

Point at which all incident rays pass when all rays parallel that will meet. Focus is known as the focal point or object.

Raytracing 1. Ray

Mirrors and lenses can make objects look bigger or smaller. Raytracing is used to figure out how light rays behave through lenses, mirrors, and other optical devices.

Raytracing 2. Image

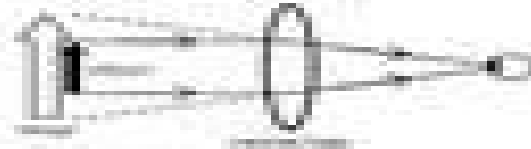

The object is what you are looking at. The image is what you see.

The image is what you see when you use the optical device, mirror, or lens.

Lenses

Lenses work by refraction, by the light bending when entering between two mediums.

A converging lens focuses light.

A converging lens is thicker in the middle than the edges.
