the first attempt to give a coherent and unified presentation of this new wave of work in philosophy of mathematics The new approach is innovative at least in two ways First it holds that there are important novel characteristics of contemporary mathematics that are just as worthy of philosophical attention as the distinction between constructive and non constructive mathematics at the time of the foundational debates Secondly it holds that many topics which escape purely formal logical treatment such as visualization explanation and understanding can nonetheless be subjected to philosophical analysis The Philosophy of Mathematical Practice comprises an introduction by the editor and eight chapters written by some of the leading scholars in the field Each chapter consists of short introduction to the general topic of the chapter followed by a longer research article in the area The eight topics selected represent a broad spectrum of contemporary philosophical reflection on different aspects of mathematical practice diagrammatic reasoning and representation systems visualization mathematical explanation purity of methods mathematical concepts the philosophical relevance of category theory philosophical aspects of computer science in mathematics the philosophical impact of recent developments in mathematical physics
