Study Guide for Biomes & Relationships

Biomes: A place characterized by the organisms that live there and determined by the abiotic factors of rainfall and temperature.

A biome can be aquatic (water) or terrestrial (land) and contain one or more ecosystems.

Land Biomes

Temperate deciduous forest- soil is fairly rich and plants cover the forest floor

- most trees are deciduous, lose their leaves in the fall to help conserve water so they can survive winter.

Coniferous/Taiga forest- conifer trees that produce their seeds in cones and do not lose their leaves in fall

- trees conserve water in the winter with the help of needlelike leaves and a waxy coating on their leaves

Tropical rain forest - receives the highest yearly average rainfall

- most biologically diverse (the most different types of plants and animals)
- soil is wet and has poor nutrients

Savanna- large herbivores live and graze on grass here, scattered clumps of trees

Temperate grassland- have small, seed eating mammals, large herbivores and no trees

Desert- plants grow far apart to reduce competition for water

- receives the lowest average yearly rainfall

Tundra- no trees, characterized by permafrost-(soil that stays frozen all the time.

- Permafrost prevents rain from draining which is how small plants survive
