Abstract

1. **What is a mutation?**
A change from wild-type, or reference genome, substitution, deletion, insertion, or change in sequence length. Substitution: change of one or more nucleotides.
2. **What is a point mutation?**
 - A mutation that is a change of a single nucleotide. Substitution: one nucleotide was replaced by another one, resulting in the reference sequence being different from the reference sequence.
3. **What is a substitution mutation?**
A mutation resulting from a nucleotide being replaced by another nucleotide. Substitution mutations can be categorized into two types: silent mutations, which do not change the amino acid sequence, and missense mutations, which do change the amino acid sequence.
4. **What is a silent mutation?**
 - A mutation that does not change the amino acid sequence. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
5. **What is a missense mutation?**
A mutation that results in a change in the amino acid sequence. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
6. **What is a nonsense mutation?**
A mutation that results in a premature stop codon, leading to a truncated protein. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
7. **What is a frameshift mutation?**
A mutation that results in a shift in the reading frame of the gene. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
8. **What is a deletion mutation?**
 - A mutation that results in the loss of one or more nucleotides. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
9. **What is an insertion mutation?**
 - A mutation that results in the gain of one or more nucleotides. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
10. **What is a duplication mutation?**
 - A mutation that results in the gain of a copy of a segment of DNA. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
11. **What is a deletion/duplication mutation?**
 - A mutation that results in the loss or gain of a segment of DNA. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
12. **What is a translocation mutation?**
 - A mutation that results in the exchange of segments between non-homologous chromosomes. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
13. **What is an inversion mutation?**
 - A mutation that results in the reversal of a segment of DNA. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
14. **What is a complex mutation?**
 - A mutation that results in a combination of two or more of the above mutations. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
15. **What is a silent mutation?**
 - A mutation that results in no change in the amino acid sequence. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
16. **What is a missense mutation?**
 - A mutation that results in a change in the amino acid sequence. This is because the genetic code is degenerate, meaning that multiple codons can code for the same amino acid.
17. **What is a nonsense mutation?**
