Nature and Environment: The Psychology of Its Benefits and Its Protection Marc Glenn Berman, 2017-04-20 Our Research Topic section entitled Nature and the environment The psychology of its benefits and its protection will have two main lines The first line of articles will center upon cutting edge research showing how interacting with nature can affect health well being and overall improve cognition and affect Articles in this line will stress in what ways nature can improve psychological functioning and health and also discuss the theories and evidence as to why nature can improve psychological functioning For this line we welcome submission of articles that discuss the psychological health and well being benefits from interacting with nature as well as submissions that focus on theoretical considerations and underlying mechanisms that lead to the restorative effects of interacting with nature Given that nature can have a positive impact on psychological functioning and overall health it is also important to understand the variables that facilitate people's recognition of environmental issues that can help foster a more positive attitude towards the preservation of nature This brings us to the second line of articles which

will center upon the psychological mechanisms that make individuals more or less likely to accept the seriousness of environmental challenges such as climate change. Given the new cutting edge research in this field we may be able to make individuals more proactive in the protection of the environment and more accepting of policy measures required to mitigate climate change. We see this research topic as a way for psychological scientists to contribute substantially to an important area of public debate and policy. For this line we welcome articles that will focus on ways in which people respond to various framings of policy relevant information and how morality may play into the individuals policy views that center on climate change and environmental protection.

Climate Changed

Mara Freilich, Irmak Turan, Jessica Varner, Lizzie Yarina, 2025-07-15 Models change our worlds. From global carbon flux models to regional coastal flood prediction maps, climate related models influence how we know our environment, how we build our cities, and how we act on a climate altered planet. Yet such models typically require specialized knowledge to navigate, and because the climate crisis is inherently multidimensional, technical expertise in isolation is not enough. *Climate Changed* examines models and their imperfect yet central role in understanding the relationship between global climate dynamics and the human built environment. It compares and synthesizes the methods and function of models in disciplines ranging from architecture and planning to climate science and natural hazards research. This book considers how disparate models are woven together to understand the climate crisis, underscoring the necessity of combining locally situated and

transdisciplinary knowledge with climate science to navigate current and future cataclysmic changes It highlights the challenges and consequences of disciplinary boundaries siloed scientific knowledge and uneven data and develops ways to overcome these limitations As the world faces the effects of climate change climate scientists are debating the future of their field architects engineers and planners are designing in the context of climate change and society at large is grappling with how to take action This book brings those communities together to chart a path forward
