

Study Guide: Physical and Chemical Oceanography

Effective composition of seawater is determined by:

- 1) Primary salinity - given amount of dissolved solids with respect to total weight, freshwater composition is 96.5% composition
- 2) Source - water coming through salt balance from atmosphere, rivers, rain, and ice melting contributes, resulting in different salinities, but all derived from same
- 3) Secondary salinities gained - through chemical composition, biologically formed oxygen and hydrogen, atmospheric air, water level for future ocean water is fixed

Effective salinity and composition as salinity:

- 1) Equivalent - same composition, same weight
- 2) Equivalent weight - equivalent to weight of sodium chloride

How temperature and salinity produce density, water volume, pressure, etc.

Temperature differences cause water layers:

- 1) warmest water starts at top, cold water is more dense
- 2) warm, less dense water is floating on a colder, denser water below
- 3) when the temperature difference persists, the water becomes isotherms to be the difference

Salinity differences cause water layers:

- 1) water with a saltier composition is denser than water with less salt
- 2) water with higher salinity, and more density, floats above of water with lower salinity
- 3) density (weight) increases as salinity increases
- 4) the higher the salinity, the higher the density, so the water is denser
