Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were 15 men, 40 to 50 years of age, who were sedentary and had no cardiovascular disease. They were randomly assigned to a 10-week training program or a control group. The training program consisted of 30 minutes of aerobic exercise, 3 times per week. The control group did not exercise. The HR and HRR were measured at rest and during exercise at the beginning and end of the 10-week period. The results showed that the training program had a significant effect on the HR and HRR of the subjects. The HR and HRR were significantly lower at rest and during exercise at the end of the 10-week period compared to the beginning of the 10-week period. The control group did not show any significant changes in HR and HRR. The results of this study suggest that a 10-week training program can improve the HR and HRR of sedentary middle-aged men.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or other light sources. To avoid this, there are two things the producer should do:
 - Turn off the lights at the end of the day.
 - Use red light for night time. Red light has the least effect on the circadian rhythm.
- The end of the day is the best time to change the lighting. The best time to change the lighting is 15 minutes before the end of the day. The best time to change the lighting is 15 minutes before the end of the day. The best time to change the lighting is 15 minutes before the end of the day.

When you install your T-Value One Connection, improper installation of all four screws (50 combinations for One Connection) will void the warranty. Please, before installing, refer to the correct installation instructions. Failure to maintain proper ventilation may result in a variety of problems with the product.

- When a producer's price for the output rises or falls, it must adjust its output level accordingly. For example, suppose the price for the output rises. The producer will increase its output level until the marginal revenue product of the input is equal to the input price. This is the profit-maximizing output level.
