Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were divided into two groups: a control group and an exercise group. The exercise group performed a 10-week training program consisting of three sessions per week of aerobic exercise. The control group did not exercise. The HR and HRR were measured at rest and during exercise at the beginning and end of the 10-week period. The results showed that the exercise group had a significant decrease in HR and HRR at rest and during exercise compared to the control group. The decrease in HR and HRR was greater in the exercise group than in the control group. The results suggest that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or natural light at night. To reduce the risk of circadian rhythm disruption, it is recommended that the amount of artificial light be reduced to the lowest level possible.
- Artificial light sources that emit light with a high color temperature (blue light) are more likely to disrupt the circadian rhythm than those that emit light with a lower color temperature (red light). To reduce the risk of circadian rhythm disruption, it is recommended that the amount of blue light be reduced to the lowest level possible.
- The use of artificial light at night can also disrupt the circadian rhythm by suppressing the production of melatonin, a hormone that helps regulate the body's internal clock. To reduce the risk of circadian rhythm disruption, it is recommended that the use of artificial light at night be minimized.
- Sleep deprivation can also lead to circadian rhythm disruption. To reduce the risk of circadian rhythm disruption, it is recommended that sleep deprivation be avoided.
