

FAN

When the slip stream is insufficient for satisfactory air flow through the radiator, the fan boosts the air flow.

To increase the effect of the fan it is surrounded by a fan ring. There is also a fan-cowling between the radiator and fan ring to force all air to the fan to pass through the radiator.

There are two fan types:

Synchronous fan

Temperature controlled fan with automatic control of engagement according to the temperature of the air passing the radiator.

The temperature controlled fan only operates when it is necessary to keep the coolant temperature on a normal level. This type of fan therefore allows for faster heating of the engine coolant, at the same time as it requires less energy and thereby contributes to reducing the fuel consumption.

The fan is driven via the friction in the silicone oil in the viscous coupling of the fan. The viscous coupling consists of coupling housing 10 with cover 4 and disc 8 driven by the engine via hub 11.

Slip is determined by the volume of silicone oil between the disc and coupling housing, increased volume results in reduced slip.
