Energy from the Sun

Thermal energy travels through space in waves called **radiation**. It travels in straight lines from the sun to Earth. The amount of energy that reaches Earth depends on the angle at which the sun's rays hit. At the equator, the rays hit directly, so the area receives more energy. At the poles, the rays hit at an angle, so the area receives less energy.

Latitude is the distance from the equator to a point on Earth. The equator is 0 degrees latitude. The poles are 90 degrees latitude. The amount of energy that reaches Earth depends on the latitude. The closer you are to the equator, the more energy you receive. The further you are from the equator, the less energy you receive.

Convection currents are the movement of fluids (liquids or gases) caused by differences in temperature. Hotter fluids expand and become less dense, so they rise. Cooler fluids contract and become more dense, so they sink. This creates a circular motion called a convection current.

How is water energy transferred? Water is heated by the sun at the equator. The water expands and becomes less dense, so it rises. The water then moves back down to the equator, creating a convection current.

How is water energy transferred at different latitudes? At the equator, the sun's rays hit directly, so the water is heated more. At the poles, the sun's rays hit at an angle, so the water is heated less. This creates a convection current.

Equator is the line around the middle of Earth. It is the point where the sun's rays hit most directly. The climate is warm and the day is long.

The Atmosphere & Oceans

Thermal energy (heat) is transferred between the sun, the atmosphere, and the oceans. The sun heats the atmosphere, which then heats the oceans. The oceans then heat the atmosphere, which then heats the land. This is a cycle of energy transfer.

Atmospheric Movement The sun heats the atmosphere, which then moves. This movement is called wind. Wind is the movement of air from one place to another.

Ocean Currents The sun heats the oceans, which then move. This movement is called ocean currents. Ocean currents are the movement of water from one place to another.

Deep Wind moves water making surface currents. The sun heats the water, which then moves. This movement is called deep wind. Deep wind is the movement of water from one place to another.

Temperature & Density

Temperature is a measure of the average kinetic energy of the particles in a substance. Density is the mass of a substance divided by its volume. Temperature and density are related. As temperature increases, density decreases. As temperature decreases, density increases.

Hot or Warm Air & Water Rises. Are less dense (molecules are spread out). Molecules move faster. Are always moving. Are in a constant motion. Molecules are more slowly.

Cold or Cool Air & Water Sinks. Are more dense (molecules are closer together). Molecules move more slowly. Are always moving. Are in a constant motion. Molecules are more slowly.

Complete the Venn Diagram

Hot or Warm Air & Water	Cold or Cool Air & Water
Rises	Sinks
