Performance Benchmarking Of Application Monitoring Frameworks:

Performance Benchmarking of Application Monitoring Frameworks Jan Waller, 2014-12-19 Application level monitoring of continuously operating software systems provides insights into their dynamic behavior helping to maintain their performance and availability during runtime Such monitoring may cause a significant runtime overhead to the monitored system depending on the number and location of used instrumentation probes In order to improve a system s instrumentation and to reduce the caused monitoring overhead it is necessary to know the performance impact of each probe While many monitoring frameworks are claiming to have minimal impact on the performance these claims are often not backed up with a detailed performance evaluation determining the actual cost of monitoring Benchmarks can be used as an effective and affordable way for these evaluations However no benchmark specifically targeting the overhead of monitoring itself exists Furthermore no established benchmark engineering methodology exists that provides guidelines for the design execution and analysis of benchmarks This thesis introduces a benchmark approach to measure the performance overhead of application level monitoring frameworks The core contributions of this approach are 1 a definition of common causes of monitoring overhead 2 a general benchmark engineering methodology 3 the MooBench micro benchmark to measure and quantify causes of monitoring overhead and 4 detailed performance evaluations of three different application level monitoring frameworks Extensive experiments demonstrate the feasibility and practicality of the approach and validate the benchmark results The developed benchmark is available as open source software and the results of all experiments are available for download to facilitate further validation and replication of the results **Live Trace Visualization for System**

and Program Comprehension in Large Software Landscapes Florian Fittkau, 2015-12-03 In many enterprises the number of deployed applications is constantly increasing Those applications often several hundreds form large software landscapes The comprehension of such landscapes is frequently impeded due to for instance architectural erosion personnel turnover or changing requirements Furthermore events such as performance anomalies can often only be understood in correlation with the states of the applications Therefore an efficient and effective way to comprehend such software landscapes in combination with the details of each application is required In this thesis we introduce a live trace visualization approach to support system and program comprehension in large software landscapes It features two perspectives a landscape level perspective using UML elements and an application level perspective following the 3D software city metaphor Our main contributions are 1 an approach named ExplorViz for enabling live trace visualization of large software landscapes 2 a monitoring and analysis approach capable of logging and processing the huge amount of conducted method calls in large software landscapes and 3 display and interaction concepts for the software city metaphor beyond classical 2D displays and 2D pointing devices Extensive lab experiments show that our monitoring and analysis approach elastically scales to large software landscapes while imposing only a low overhead on the productive systems Furthermore several controlled

experiments demonstrate an increased efficiency and effectiveness for solving comprehension tasks when using our visualization ExplorViz is available as open source software on www.explorviz.net Additionally we provide extensive experimental packages of our evaluations to facilitate the verifiability and reproducibility of our results

serves as both a textbook and handbook on the benchmarking of systems and components used as building blocks of modern information and communication technology applications. It provides theoretical and practical foundations as well as an in-depth exploration of modern benchmarks and benchmark development. The book is divided into two parts: foundations and applications. The first part introduces the foundations of benchmarking as a discipline covering the three fundamental elements of each benchmarking approach: metrics, workloads, and measurement methodology. The second part focuses on different application areas, presenting contributions in specific fields of benchmark development. These contributions address the unique challenges that arise in the conception and development of benchmarks for specific systems or subsystems and they demonstrate how the foundations and concepts in the first part of the book are being used in existing benchmarks. Further, the book presents a number of concrete applications and case studies based on input from leading benchmark developers from consortia such as the Standard Performance Evaluation Corporation (SPEC) and the Transaction Processing Performance Council (TPC). Besides a number of updates in almost all chapters for this new edition, three chapters are added in Part II of the book: 1. Machine Learning and Artificial Intelligence to cater the growing need to evaluate and benchmark ML and AI systems; 2. Scalability of Networks and Systems focusing on novel metrics and techniques to evaluate scalability; and 3. PC Workstation Graphics and Network Benchmarks covering popular benchmarks like SYSmark, PCMark, Phoronix Test Suite, 3DMark, the Blender benchmark, and end-to-end network performance tools. Providing both practical and theoretical foundations as well as a detailed discussion of modern benchmarks and their development, the book is intended as a handbook for professionals and researchers working in areas related to benchmarking. It offers an up-to-date point of reference for existing work as well as latest results, research challenges, and future research directions. It also can be used as a textbook for graduate and postgraduate students studying any of the many subjects related to benchmarking. While readers are assumed to be familiar with the principles and practices of computer science as well as software and systems engineering, no specific expertise in any subfield of these disciplines is required.
