Nonlinear Water Waves David Henry,Konstantinos Kalimeris,Emilian I. Părau,Jean-Marc Vanden-Broeck,Erik Wahlén,2019-11-27 The motion of water is governed by a set of mathematical equations which are extremely complicated and intractable This is not surprising when one considers the highly diverse and intricate physical phenomena which may be exhibited by a given body of water Recent mathematical advances have enabled researchers to make major progress in this field reflected in the topics featured in this volume Cutting edge techniques and tools from mathematical analysis have

generated strong rigorous results concerning the qualitative and quantitative physical properties of solutions of the governing equations Furthermore accurate numerical computations of fully nonlinear steady and unsteady water waves in two and three dimensions have contributed to the discovery of new types of waves Model equations have been derived in the long wave and modulational regime using Hamiltonian formulations and solved numerically This book brings together interdisciplinary researchers working in the field of nonlinear water waves whose contributions range from survey articles to new research results which address a variety of aspects in nonlinear water waves It is motivated by a workshop which was organised at the Erwin Schrödinger International Institute for Mathematics and Physics in Vienna November 27 December 7 2017 The key aim of the workshop was to describe and foster new approaches to research in this field This is reflected in the contents of this book which is aimed to stimulate both experienced researchers and students alike

New Trends and Results in Mathematical Description of Fluid Flows Miroslav Bulíček, Eduard Feireisl, Milan Pokorný, 2018-09-26 The book presents recent results and new trends in the theory of fluid mechanics Each of the four chapters focuses on a different problem in fluid flow accompanied by an overview of available older results The chapters are extended lecture notes from the ESSAM school Mathematical Aspects of Fluid Flows held in Kocov Czech Republic in May June 2017 The lectures were presented by Dominic Breit Heriot Watt University Edinburgh Yann Brenier Polytechnique Palaiseau Pierre Emmanuel Jabin University of Maryland and Christian Rohde Universität Stuttgart and cover various aspects of mathematical fluid mechanics from Euler equations compressible Navier Stokes equations and stochastic equations in fluid mechanics to equations describing two phase flow from the modeling and mathematical analysis of equations to numerical methods Although the chapters feature relatively recent results they are presented in a form accessible to PhD students in the field of mathematical fluid mechanics

in this book problematize the violence of genocide trauma and flight as they are variously and singularly underpinned by silences that signal the failure of adequate avenues for articulation of what impact such violence has on its victims Other chapters focus on the style of Owuor's writing thereby highlighting the many literary innovations that Owuor crafts in order to effectively carry the weight of her concerns This book will be of interest to scholars and advanced students of Literature Politics History and Sociology It was originally published as a special issue of the journal Eastern African Literary and Cultural Studies

Analytical Methods for Nonlinear Oscillators and Solitary Waves Chu-Hui He, Hamid M. Sedighi, Ji-Huan He, Yusry El-Dib, Dragan Marinkovic, 2023-11-24 The most well known analytical method is the perturbation method which has led to the great discovery of Neptune in 1846 and since then mathematical prediction and empirical observation became two sides of a coin in physics However the perturbation method is based on the small parameter assumption and the obtained solutions are valid only for weakly nonlinear equations which have greatly limited their applications to modern physical problems To overcome the shortcomings many mathematicians and physicists have been extensively developing various technologies for several centuries however there is no universal method for all nonlinear problems and mathematical prediction with remarkably high accuracy is still much needed for modern physics for example the solitary waves traveling along an unsmooth boundary the low frequency property of a harvesting energy device the pull in voltage in a micro electromechanical system Now various effective analytical methods have appeared in the open literature e g the homotopy perturbation method and the variational iteration method An analytical solution provides a fast insight into its physical properties of a practical problem e g frequency amplitude relation of a nonlinear oscillator solitary wave in an optical fiber pull in instability of a microelectromechanical system making mathematical prediction even more attractive in modern physics Nonlinear physics has been developing into a new stage where the fractal fractional differential equations have to be adopted to describe more accurately discontinuous problems and it becomes ever more difficult to find an analytical solution for such nonlinear problems and the analytical methods for fractal fractional differential equations have laid the foundations for nonlinear physics
