studies **Glassy Materials Based Microdevices** Giancarlo C. Righini, Nicoletta Righini, 2019-02-28 Microtechnology has changed our world since the last century when silicon microelectronics revolutionized sensor control and communication areas with applications extending from domotics to automotive and from security to biomedicine. The present century however is also seeing an accelerating pace of innovation in glassy materials as an example glass ceramics which successfully combine the properties of an amorphous matrix with those of micro or nano crystals offer a very high flexibility of design to chemists, physicists and engineers who can conceive and implement advanced microdevices. In a very similar way the synthesis of glassy polymers in a very wide range of chemical structures offers unprecedented potential of applications. The contemporary availability of microfabrication technologies such as direct laser writing or 3D printing which add to the most common processes deposition lithography and etching facilitates the development of novel or advanced microdevices based on glassy materials. Biochemical and biomedical sensors especially with the lab on a chip target are one of the most evident proofs of the success of this material platform. Other applications have also emerged in environment food and chemical industries. The present Special Issue of Micromachines aims at reviewing the current state of the art and presenting perspectives of further development. Contributions related to the technologies glassy materials design and fabrication processes characterization and eventually applications are welcome.

Functional Polymers in Food Science Giuseppe Cirillo, Umile Gianfranco Spizzirri, Francesca Iemma, 2015-03-18 Polymers are an important part in everyday life products made from polymers range from sophisticated articles such as biomaterials to aerospace materials. One of the reasons for the great popularity exhibited by polymers is their ease of processing. Polymer properties can be tailored to meet specific needs by varying the atomic composition of the repeat structure by varying molecular weight and by the incorporation via covalent and non covalent interactions of an enormous range of compounds to impart specific activities. In food science the use of polymeric materials is widely explored from both an engineering and a nutraceutical point of view. Regarding the engineering application researchers have discovered the most suitable materials for intelligent packaging which preserves the food quality and prolongs the shelf life of the products. Furthermore in agriculture specific functionalized polymers are used to increase the efficiency of treatments and reduce the environmental pollution. In the nutraceutical field because consumers are increasingly conscious of the relationship between diet and health the consumption of high quality foods has been growing continuously. Different compounds e.g. high quality proteins lipids and polysaccharides are well known to contribute to the enhancement of human health by different mechanisms reducing the risk of cardiovascular disease coronary disease and hypertension. This second volume focuses on the importance of polymers and functional food and in food processing.
