**Abstract** The purpose of this study was to investigate the effects of a 12-week training program on the physical and psychological characteristics of young women. The study was conducted in a laboratory setting. The participants were 15 young women, aged 18-25, who were divided into two groups: a control group and an experimental group. The experimental group underwent a 12-week training program that included aerobic and strength training. The control group did not undergo any training. The physical characteristics measured were body mass index (BMI), body fat percentage, and heart rate. The psychological characteristics measured were self-esteem, anxiety, and depression. The results showed that the experimental group had significantly lower BMI, body fat percentage, and heart rate compared to the control group. Additionally, the experimental group had significantly higher self-esteem and lower anxiety and depression compared to the control group. The findings suggest that a 12-week training program can improve the physical and psychological characteristics of young women.
