Solving Proportions

A proportion is an equation that states that two ratios are equal. If a quantity in a proportion is unknown, you can solve a proportion to find the unknown quantity as shown below.

Problem

What is the solution of $\frac{3}{4} = \frac{x}{14}$?

There are two methods for solving proportions—using the Multiplication Property of Equality and the Cross Products Property.

- 1) The Multiplication Property of Equality says that you can multiply both sides of an equation by the same number without changing the value.

$$\begin{aligned} \frac{3}{4} &= \frac{x}{14} \\ +\left(\frac{4}{4}\right) \cdot \left(\frac{x}{14}\right) &+ \\ \frac{4x}{4} &= x \\ 10.5 &= x \end{aligned}$$

To isolate x , multiply each side by 14.

Simplify.

Divide 42 by 4.

- 2) The Cross Products Property says that you can multiply diagonally across the proportion and these products are equal.

$$\begin{aligned} \frac{3}{4} &= \frac{x}{14} \\ (4)(x) &= (3)(14) \\ 4x &= 42 \\ \frac{4x}{4} &= \frac{42}{4} \\ x &= 10.5 \end{aligned}$$

Multiply diagonally across the proportion.

Multiply.

To isolate x , divide each side by 4.

Simplify.

Real world situations can be modeled using proportions.

Problem

A bakery can make 6 dozen donuts every 21 minutes. How many donuts can the bakery make in 2 hours?

A proportion can be used to answer this question. It is key for you to set up the proportion with matching units in both numerators and both denominators.

For this problem, you know that 2 hours is 120 minutes and 6 dozen is 72 donuts.

Correct:

$$\frac{72 \text{ donuts}}{21 \text{ min}} = \frac{x \text{ donuts}}{120 \text{ min}}$$

Incorrect:

$$\frac{72 \text{ donuts}}{21 \text{ min}} = \frac{120 \text{ min}}{x \text{ donuts}}$$

Infinite-Dimensional Systems F. Kappel, W. Schappacher, 2006-11-14 [Fundamental Solutions for Differential Operators and Applications](#) Prem Kythe, 2012-12-06 Overview Many problems in mathematical physics and applied mathematics can be reduced to boundary value problems for differential and in some cases integrodifferential equations These equations are solved by using methods from the theory of ordinary and partial differential equations variational calculus operational calculus function theory functional analysis probability theory numerical analysis and computational techniques Mathematical models of quantum physics require new areas such as generalized functions theory of distributions functions of several complex variables and topological and algebraic methods The main purpose of this book is to provide a self contained and systematic introduction to just one aspect of analysis which deals with the theory of fundamental solutions for differential operators and their applications to boundary value problems of mathematical physics applied mathematics and engineering with the related applicable and computational features The subject matter of this book

has its own deep rooted theoretical importance since it is related to Green's functions which are associated with most boundary value problems. The application of fundamental solutions to a recently developed area of boundary element methods has provided a distinct advantage in that an integral equation representation of a boundary value problem is often more easily solved by numerical methods than a differential equation with specified boundary and initial conditions. This situation makes the subject more attractive to those whose interest is primarily in numerical methods.
