35.1 Introduction

The design of autopilots for high-performance aircraft was one of the primary motivations for active research in adaptive control in the early 1950s. Aircrafts operate over a wide range of speeds and altitudes, and their dynamics are nonlinear and conceptually time-varying. For a given operating point, specified by the aircraft speed (Mach number) and altitude, the longitudinal nonlinear aircraft dynamics can be approximated by a linear model. As the aircraft goes through different flight conditions, the operating point changes. These changes cannot be handled by constant gain feedback control. Since the output response $y(t)$ carries information about the state as well as the parameters, one may argue that in principle, a sophisticated feedback controller should be able to learn about the plant changes by processing the input/output (I/O) measurements (u, y) and choosing the appropriate controller from a list or design a new one in real-time. The real-time or on-the-fly selection or design of the controller is what distinguishes adaptive from nonadaptive schemes. Figure 35.1 illustrates this general adaptive control structure. The structure covers almost all classes of adaptive control. The idea is to process the I/O and possibly auxiliary measurements and decide what controller to use in real-time. Under this generic structure one can include gain scheduling where the real time controller design block is just a look-up table with a scheduler logic. In identifier-based schemes, this block includes a parameter estimator and the online calculation of the controller whereas in nonidentifier-based schemes, the block may consist of multiple models, stored controllers, and so on and an appropriate logic for selecting the right controller in real-time. Structures such as direct and indirect adaptive control also fall into this general feedback structure.

Robust Adaptive Control Solution Manual:

Model-Reference Adaptive Control Nhan T. Nguyen, 2018-03-01 This textbook provides readers with a good working knowledge of adaptive control theory through applications. It is intended for students beginning masters or doctoral courses and control practitioners wishing to get up to speed in the subject expeditiously. Readers are taught a wide variety of adaptive control techniques starting with simple methods and extending step by step to more complex ones. Stability proofs are provided for all adaptive control techniques without obfuscating reader understanding with excessive mathematics. The book begins with standard model reference adaptive control MRAC for first order second order and multi input multi output systems. Treatment of least squares parameter estimation and its extension to MRAC follow helping readers to gain a different perspective on MRAC. Function approximation with orthogonal polynomials and neural networks and MRAC using neural networks are also covered. Robustness issues connected with MRAC are discussed helping the student to appreciate potential pitfalls of the technique. This appreciation is encouraged by drawing parallels between various aspects of robustness and linear time invariant systems wherever relevant. Following on from the robustness problems is material covering robust adaptive control including standard methods and detailed exposition of recent advances in particular the author's work on optimal control modification. Interesting properties of the new method are illustrated in the design of adaptive systems to meet stability margins. This method has been successfully flight tested on research aircraft one of various flight control applications detailed towards the end of the book along with a hybrid adaptive flight control architecture that combines direct MRAC with least squares indirect adaptive control. In addition to the applications understanding is encouraged by the use of end of chapter exercises and associated MATLAB files. Readers will need no more than the standard mathematics for basic control theory such as differential equations and matrix algebra. The book covers the foundations of MRAC and the necessary mathematical preliminaries.

Adaptive Control Design and Analysis Gang Tao, 2003-07-09 A systematic and unified presentation of the fundamentals of adaptive control theory in both continuous time and discrete time. Today adaptive control theory has grown to be a rigorous and mature discipline. As the advantages of adaptive systems for developing advanced applications grow apparent, adaptive control is becoming more popular in many fields of engineering and science. Using a simple balanced and harmonious style, this book provides a convenient introduction to the subject and improves one's understanding of adaptive control theory. Adaptive Control Design and Analysis features: Introduction to systems and control; Stability; operator norms and signal convergence; Adaptive parameter estimation; State feedback adaptive control designs; Parametrization of state observers for adaptive control; Unified continuous and discrete time adaptive control; L1 a robustness theory for adaptive systems; Direct and indirect adaptive control designs; Benchmark comparison study of adaptive control designs; Multivariate adaptive control; Nonlinear adaptive control; Adaptive compensation of actuator nonlinearities; End of chapter discussion problems and advanced topics. As either a textbook or reference, this self contained

tutorial of adaptive control design and analysis is ideal for practicing engineers researchers and graduate students alike

Robust and Adaptive Control Eugene Lavretsky, Kevin A. Wise, 2024-02-20 Robust and Adaptive Control second edition shows readers how to produce consistent and accurate controllers that operate in the presence of uncertainties and unforeseen events Driven by aerospace applications the focus of the book is primarily on continuous time dynamical systems The two part text begins with robust and optimal linear control methods and moves on to a self contained presentation of the design and analysis of model reference adaptive control for nonlinear uncertain dynamical systems Features of the second edition include sufficient conditions for closed loop stability under output feedback observer based loop transfer recovery OBLTR with adaptive augmentation OBLTR applications to aerospace systems case studies that demonstrate the benefits of robust and adaptive control for piloted autonomous and experimental aerial platforms realistic examples and simulation data illustrating key features of the methods described and problem solutions for instructors and MATLAB code provided electronically The theory and practical applications address real life aerospace problems being based on numerous transitions of control theoretic results into operational systems and airborne vehicles drawn from the authors extensive professional experience with The Boeing Company The systems covered are challenging often open loop unstable with uncertainties in their dynamics and thus require both persistently reliable control and the ability to track commands either from a pilot or a guidance computer Readers should have a basic understanding of root locus Bode diagrams and Nyquist plots as well as linear algebra ordinary differential equations and the use of state space methods in analysis and modeling of dynamical systems The second edition contains a background summary of linear systems and control systems and an introduction to state observers and output feedback control helping to make it self contained Robust and Adaptive Control teaches senior undergraduate and graduate students how to construct stable and predictable control algorithms for realistic industrial applications Practicing engineers and academic researchers will also find the book of great instructional value The solutions manual can be accessed by instructors who have adopted this book for their courses at <https://sites.google.com/springernature.com/extramaterial> lecturer material To find the electronic supplementary
