Pallikarakis, Panagiotis D. Bamidis, 2010-05-28 Over the past three decades the exploding number of new technologies and applications introduced in medical practice often powered by advances in biosignal processing and biomedical imaging created an amazing account of new possibilities for diagnosis and therapy but also raised major questions of appropriateness and safety The accelerated development in this field alongside with the promotion of electronic health care solutions is often on the basis of an uncontrolled diffusion and use of medical technology The emergence and use of medical devices is multiplied rapidly and today there exist more than one million different products available on the world market Despite the fact that the rising cost of health care partly resulting from the new emerging technological applications forms the most serious and urgent problem for many governments today another important concern is that of patient safety and user protection issues that should never be compromised and expelled from the Biomedical Engineering research practice agenda

McCrimmon, Gregoire P. Millet, 2018-01-25 In the past traditional moderate intensity continuous training 60 75% peak heart rate was the type of physical activity most frequently recommended for both athletes and clinical populations of American College of Sports Medicine guidelines However growing evidence indicates that high intensity interval training 80 100% peak heart rate could actually be associated with larger cardiorespiratory fitness and metabolic function benefits and thereby physical performance gains for athletes Similarly recent data in obese and hypertensive individuals indicate that various mechanisms further improvement in endothelial function reductions in sympathetic neural activity or in arterial stiffness might be involved in the larger cardiovascular protective effects associated with training at high exercise intensities Concerning hypoxic training similar trends have been observed from traditional prolonged altitude sojourns Live High Train High or Live High Train Low which result in increased hemoglobin mass and blood carrying capacity Recent innovative Live

Low Train High methods Resistance Training in Hypoxia or Repeated Sprint Training in Hypoxia have resulted in peripheral adaptations such as hypertrophy or delay in muscle fatigue Other interventions inducing peripheral hypoxia such as vascular occlusion during endurance resistance training or remote ischemic preconditioning i e succession of ischemia reperfusion episodes have been proposed as methods for improving subsequent exercise performance or altitude tolerance e g reduced severity of acute mountain sickness symptoms Postulated mechanisms behind these metabolic neuro humoral hemodynamics and systemic adaptations include stimulation of nitric oxide synthase increase in anti oxidant enzymes and down regulation of pro inflammatory cytokines although the amount of evidence is not yet significant enough Improved O₂ delivery utilization conferred by hypoxic training interventions might also be effective in preventing and treating cardiovascular diseases as well as contributing to improve exercise tolerance and health status of patients For example in obese subjects combining exercise with hypoxic exposure enhances the negative energy balance which further reduces weight and improves cardio metabolic health In hypertensive patients the larger lowering of blood pressure through the endothelial nitric oxide synthase pathway and the associated compensatory vasodilation is taken to reflect the superiority of exercising in hypoxia compared to normoxia A hypoxic stimulus in addition to exercise at high vs moderate intensity has the potential to further ameliorate various aspects of the vascular function as observed in healthy populations This may have clinical implications for the reduction of cardiovascular risks Key open questions are therefore of interest for patients suffering from chronic vascular or cellular hypoxia e g work rest or ischemia reperfusion intermittent pattern exercise intensity hypoxic severity and exposure duration type of hypoxia normobaric vs hypobaric health risks magnitude and maintenance of the benefits Outside any potential beneficial effects of exercising in O₂ deprived environments there may also be long term adverse consequences of chronic intermittent severe hypoxia Sleep apnea syndrome for instance leads to oxidative stress and the production of reactive oxygen species and ultimately systemic inflammation Postulated pathophysiological changes associated with intermittent hypoxic exposure include alteration in baroreflex activity increase in pulmonary arterial pressure and hematocrit changes in heart structure and function and an alteration in endothelial dependent vasodilation in cerebral and muscular arteries There is a need to explore the combination of exercising in hypoxia and association of hypertension developmental defects neuro pathological and neuro cognitive deficits enhanced susceptibility to oxidative injury and possibly increased myocardial and cerebral infarction in individuals sensitive to hypoxic stress The aim of this Research Topic is to shed more light on the transcriptional vascular hemodynamics neuro humoral and systemic consequences of training at high intensities under various hypoxic conditions
