

Hormone	Action	Commercial Application
Auxins	Influence cell division, cell elongation, cell differentiation affecting apical dominance, tropisms, flowering, abscission and senescence.	Development of transgenic plants without seeds (e.g strawberry, tomato, eggplant); applied to seedless fruit to make them grow larger; encourage root formation in plant cuttings and growth in plant tissue culture; as weed killers
Gibberellins	Increases elongation growth- e.g. they cause the rapid growth of internodes in stems making the plant grow taller.	Applied to increase fruit size (e.g. Grapes) and increase the distance between fruit on a stem. Can be used to break seed dormancy—encouraging the seed to germinate.
Ethylene	Promoted ripening of fruits and abscission (falling) of leaves.	Can be used to make fruit ripen earlier than it would naturally.
Cytokinins	Regulate cell division.	Promotes the growth of lateral buds in flowering plants.
Absciscic Acid	Inhibits other hormones—promoting dormancy in plants and seeds.	No commercial applications as the cost of producing synthetic versions of this hormone are too high.
