Robot sensors and transducers S Ruocco,2013-06-29 The use of sensor s with machines whether to control them continuously or to inspect and verify their operation can be highly cost effective in particular areas of industrial automation Examples of such areas include sensing systems to monitor tool condition force and torque sensing for robot assembly systems vision based automatic inspection and tracking sensor s for robot arc welding and seam sealing Many think these will be the basis of an important future industry So far design of sensor systems to meet these needs has been in the interest of cheapness rather ad hoc and carefully tailored to the application both as to the transducer hardware and the associated processing software There are now however encouraging signs of commonality emerging between different sensor application areas For instance many commercial vision systems and some tactile systems just emerging from research are able to use more or less standardized techniques for two dimensional image processing and shape representation Structured light triangulation systems can be applied with relatively minor hardware and software variations to measure three dimensional profiles of objects as diverse as individual soldered joints body pressings and weldments Sensors make it possible for machines to recover sensibly from errors and standard software proce dures such as expert systems can now be applied to facilitate this
