Preprocessing: Conversion Ready Feedstocks J. Richard Hess,Allison E. Ray,Timothy G. Rials,2020-03-12 The success of lignocellulosic biofuels and biochemical industries depends upon an economic and reliable supply of quality biomass However research and development efforts have historically focused on the utilization of agriculturally derived cellulosic feedstocks without consideration of their low energy density high variations in physical and chemical characteristics and potential supply risks in terms of availability and affordability This Research Topic will explore strategies that enable supply chain improvements in biomass quality and consistency through blending preprocessing diversity and landscape design for development of conversion ready lignocellulosic feedstocks for production of biofuels and bio products Biomass variability has proven a formidable challenge to the emerging biorefining industry impeding continuous operation and reducing yields required for economical production of lignocellulosic biofuels at scale Conventional supply systems lack the preprocessing capabilities necessary to ensure consistent biomass feedstocks with physical and chemical properties that are compatible with supply chain operations and conversion processes Direct coupling of conventional feedstock supply systems with sophisticated conversion systems has reduced the operability of biorefining processes to less than 50% As the bioeconomy grows the inherent variability of biomass resources cannot be managed by passive means alone As such there is a need to fully recognize the magnitude of biomass variability and uncertainty as well as the cost of failing to design feedstock supply systems that can mitigate biomass variability and uncertainty A paradigm shift is needed from biorefinery designs using raw

single resource biomass to advanced feedstock supply systems that harness diverse biomass resources to enable supply chain resilience and development of conversion ready feedstocks Blending and preprocessing e g drying sorting sizing fractionation leaching densification etc can mitigate variable quality and performance in diverse resources when integrated with downstream conversion systems Decoupling feedstock supply from biorefining provides an opportunity to manage supply risks and incorporate value added upgrading to develop feedstocks with improved convertibility and or market fungibility Conversion ready feedstocks have undergone the required preprocessing to ensure compatibility with conversion and utilization prior to delivery at the biorefinery and represent lignocellulosic biomass with physical and chemical properties that are tailored to meet the requirements of industrially relevant handling and conversion systems *Importance of Root*

Symbiomes for Plant Nutrition: New Insights, Perspectives, and Future Challenges Kevin Garcia, Heike Bücking, Sabine Dagmar Zimmermann, 2020-07-01 **Life Cycle Assessment (LCA) of Light-Weight Eco-composites** Miao

Guo, 2013-01-11 Miao Guo's PhD thesis provides scientific insights into the environmental issues related to biocomposites based on starch polyvinyl alcohol PVOH blends The author contributes significantly to the methodological issues underlying the Life Cycle Assessment LCA modelling approach As well as presenting complete LCA inventories using primary data from a variety of sources Guo develops a new modelling approach incorporating the process oriented biogeochemistry model Denitrification Decomposition DNDC into site specific LCA studies to simulate carbon and nitrogen dynamics in the wheat agro ecosystem This thesis addresses important LCA data quality issues by using comprehensive sensitivity and uncertainty analyses and has resulted in a large number of publications in internationally renowned journals **Critical and Rare**
