Functional Genomics Stephen P. Hunt, Frederick Livesey, 2000 With the complete genomes of many organisms now available and the first draft of the human genome imminent there is an increasing demand from researchers in a range of disciplines for techniques that will allow them to utilize these resources in their own research This book provides a comprehensive treatment of the range of methods available for gene and protein expression profiling in a variety of systems These include large scale methods such as cDNA microarrays serial analysis of gene expression SAGE and proteomics and also methods suitable for non specialist laboratories such as differential display and suppression subtraction hybridization In all cases the chapters have been written by the developers of these methods or experienced users and include detailed protocols to facilitate the introduction of these methods to the readers laboratories Technologies for Detection of DNA Damage and Mutations G.P. Pfeifer, 2013-11-11 Man made carcinogens natural genotoxic agents in the environment as well as ionizing and ultraviolet radiation can damage DNA and are a constant threat to genome integrity Throughout the evolution of life complex DNA repair systems have developed in all living organisms to cope with this damage Unrepaired DNA lesions can promote genetic alterations mutations that may be linked to an altered phenotype and if growth controlling genes are involved these mutations can lead to cell transformation and the development of malignant tumors Proto oncogenes and tumor suppressor genes may be critical targets for DNA damaging agents In a number of animal model systems correlations between exposure to a carcinogen tumor development and genetic changes in tumor DNA have been established To understand mutagenesis processes in more detail at the molecular level we need to know the type and frequency of DNA adducts within cells their distribution along genes and specific DNA sequences as well as the rates at which they are repaired We also need to know what types of mutations are produced and which gene positions are most prone to mutagenesis This book provides a collection of techniques that are useful in mutagenesis research The book is divided into three parts In Part I methods for DNA damage and repair analysis are provided **Nucleic Acid Amplification**

Technologies Helen H. Lee, Stephen A. Morse, Ørjan Olsvik, 1997-07-15 Providing current information and guidance on the uses of various nucleic acid amplification technologies for clinical laboratory diagnosis this book goes beyond the Polymerase Chain Reaction to explore a broader range of important alternative DNA RNA amplification methods including the Ligase Chain Reaction Q beta Replicase Assays and TMA There are many examples of specific applications of these technologies

discussions of yet unresolved issues and demonstrations of the relevance of these technologies to medical research and disease diagnostics Individual chapters cover uses of these methods in clinical situations such as detection of food pathogens viral infections STDs Mycobacteria drug resistance mutations and heritable diseases Automation diagnostic test evaluation and the synthesis of artificial DNA are also discussed This book is designed for all biomedical scientists interested in the application of molecular biology to clinical diagnosis **Energy Wastes in the Ocean** Iver W.
