

The Cell Cycle and Mitosis

- Process of cell growth and division

Mitosis:

- Interphase**
 - Cell prepares to divide (DNA and organelles are **replicated**, and **ATP** content is increased)
- Prophase**
 - Chromosomes **condense** and centrioles move to opposite ends of the cell forming a **spindle**
 - Nuclear envelope breaks down and chromosomes are **free in the cytoplasm**
- Metaphase**
 - Chromosomes **line up** along the spindle where they attach themselves by their centromere
 - CHECKPOINT**: cell checks that all the chromosomes are attached to the spindle
- Anaphase**
 - Centromeres divide, separating each pair of sister chromatids
 - Spindles **contract**, pulling the centromeres to opposite ends of the cell
- Telophase**
 - Chromatids reach opposite poles of the spindle, uncoiling to become chromosomes again
 - Nuclear envelopes form around each group of chromosomes to form two nuclei
- Cytokinesis (separate process to mitosis)**
 - Begins in anaphase and ends in telophase
 - Cytoplasm divides
 - Cleavage furrow forms to divide the cell membrane
