

1) Relative Dating Application (3 pts, 1/2pt each)

A geological cross-section diagram illustrating various rock layers and structural features. The diagram shows a sequence of layers: a top yellow layer, followed by a grey layer, a blue layer with a brick-like texture, and another yellow layer. Below these, there are layers of grey, blue, and orange. A prominent fault line runs diagonally from the top left towards the bottom center. Another fault line runs vertically on the right side. A large, light grey, irregularly shaped mass is located in the lower center. Several numbered points (1 through 15) are marked throughout the diagram, indicating specific locations of interest. The layers are color-coded: yellow, grey, blue, and orange.

- Which labeled unit of the cross section is the youngest?
- Is **Fault P** older or younger than layer **L**?
- Is **Dyke B** older or younger than the unconformity **R**?
- If units **N** and **L** are made of sedimentary rocks, what type of unconformity is **R**?
- Which came first folding or the igneous intrusion **A**?
- Which labeled unit of the cross section is the oldest?

Why is radiometric dating the most reliable method for absolute dating of the geologic past? Why is a closed system important? Why does radiometric dating give an incorrect date for the formation of sedimentary rocks like sandstone?
