Practical Channel-Aware Resource Allocation Michael Ghorbanzadeh,Ahmed Abdelhadi,2021-07-08 This book dives into radio resource allocation optimizations a research area for wireless communications in a pragmatic way and not only includes wireless channel conditions but also incorporates the channel in a simple and practical fashion via well understood equations Most importantly the book presents a practical perspective by modeling channel conditions using terrain aware propagation which narrows the gap between purely theoretical work and that of industry methods The provided propagation modeling reflects industry grade scenarios for radio environment map and hence makes the channel based resource allocation presented in the book a field grade view Also the book provides large

scale simulations that account for realistic locations with terrain conditions that can produce realistic scenarios applicable in the field Most portions of the book are accompanied with MATLAB code and occasionally MATLAB Python C code The book is intended for graduate students academics researchers of resource allocation in mathematics computer science and electrical engineering departments as well as working professionals engineers in wireless industry *ICCWS 2019 14th International Conference on Cyber Warfare and Security* Noëlle van der Waag-Cowling,Louise Leenen,2019-02-28

Systems Biology of Transcription Regulation Ekaterina Shelest,Edgar Wingender,Joerg Linde,2016-09-09 Transcription regulation is a complex process that can be considered and investigated from different perspectives Traditionally and due to technical reasons including the evolution of our understanding of the underlying processes the main focus of the research was made on the regulation of expression through transcription factors TFs the proteins directly binding to DNA On the other hand intensive research is going on in the field of chromatin structure remodeling and its involvement in the regulation Whatever direction we select we can speak about several levels of regulation For instance concentrating on TFs we should consider multiple regulatory layers starting with signaling pathways and ending up with the TF binding sites in the promoters and other regulatory regions However it is obvious that the TF regulation also including the upstream processes represents a modest portion of all processes leading to gene expression For more comprehensive description of the gene regulation we need a systematic and holistic view which brings us to the importance of systems biology approaches Advances in methodology especially in high throughput methods result in an ever growing mass of data which in many cases is still waiting for appropriate consideration Moreover the accumulation of data is going faster than the development of algorithms for their systematic evaluation Data and methods integration is indispensable for the acquiring a systematic as well as a systemic view In addition to the huge amount of molecular or genetic components of a biological system the even larger number of their interactions constitutes the enormous complexity of processes occurring in a living cell organ organism In systems biology these interactions are represented by networks Transcriptional or more generally gene regulatory networks are being generated from experimental ChIPseq data by reverse engineering from transcriptomics data or from computational predictions of transcription factor TF target gene relations While transcriptional networks are now available for many biological systems mathematical models to simulate their dynamic behavior have been successfully developed for metabolic and to some extent for signaling networks but relatively rarely for gene regulatory networks Systems biology approaches provide new perspectives that raise new questions Some of them address methodological problems others arise from the newly obtained understanding of the data These open questions and problems are also a subject of this Research Topic
