Computer Simulation and Computer Algebra Dietrich Stauffer, Friedrich W Hehl, Volker Winkelmann, John G. Zabolitzky, 2012-12-06 Computers play an increasingly important role in many of today's activities and correspondingly physicists find employment after graduation in computer related jobs often quite remote from their physics education The present lectures on the other hand emphasize how we can use computers for the purposes of fundamental research in physics Thus we do not deal with programs designed for newspapers banks or travel agencies i e word processing and storage of large amounts of data Instead our lectures concentrate on physics problems where the computer often has to work quite hard to get a result Our programs are necessarily quite short excluding for example quantum chemistry programs with 10 program lines The reader will learn how to handle computers for well defined purposes Therefore in the end this course will also enable him to orient himself in computer related jobs The first chapter deals mainly with solutions of the Newtonian equation of motion that force equals mass times acceleration which is a precursor to the molecular dynamics method in statistical physics The second chapter considers by means of several examples another method for statistical physics Monte Carlo simulation These two chapters deal with numbers the traditional territory of computers In contrast analytic formula manipulation such as $a^{27}b^{4c^5}a^{135a}b$ is taught in the last chapter and is important for instance in analytic integration or for evaluating expressions in Einstein's general theory of relativity
