

## PHOTOLYSE STEMS AND LEAVES

Plants have structures that allow them to absorb light energy and convert it into glucose and oxygen.

### Light energy from the sun is used to make glucose.

This is done in a process called photosynthesis.

- 1. Light energy is absorbed by chlorophyll in the leaves.
- 2. The light energy is used to split water molecules into hydrogen and oxygen.
- 3. The hydrogen is then used to reduce carbon dioxide into glucose.

### Plants have two main types of leaves: broad and needle-like.

Broad leaves are found in plants that live in temperate climates. They have a large surface area to absorb light energy. Needle-like leaves are found in plants that live in cold climates. They have a small surface area to reduce water loss.
