

Trends on the Periodic Table

Part 3: Identifying chemical properties/characteristics of the elements

For each of the following elements, draw a caricature or cartoon above the description to show its "chemical personality" based on the description provided. (Note: See the Neon example for ideas.)

Boron, one of the smaller elements with only 3 electrons, boron is happy to give one of its electrons away and never expects to ask for any in return.

1

Francium
Francium is the largest of all the elements and has no more electrons than it has protons keeping track of them. Francium will eagerly give up electrons to other elements and never takes in extras. That which cost, it has an extremely reactive and explosive personality!

Fluorine
One of the smallest elements, fluorine is often described as nonmetallic with a "magnetic" personality. As part of the halogen family fluorine has one electron fewer than the noble gases. Fluorine is the best at convincing other elements to give up their electrons to her. However, it holds on tight to her own electrons and will not let them go without a fight.

If you are positive... If there is still
doubt about it, I don't mind those
other answers.... If there they just
haven't any others?

100 200 300 400

Part of the Noddy family. Noddy
does not readily interact with
other elements. With a full set
of resilience techniques. Noddy
feels that he has everything he
needs to make him happy
without changing with others.

Part 2: Use your textbook to complete the following.

Atomic Radii Size

1. Explain atomic radius: A measure of the size (volume) of an atom. Determined by measuring half of the distance between two identical atoms bonded together.
 2. Using the information in figure 5-13 (pg 141) in your book, write the atomic radii size for alkali metals & period #2 on the periodic table to your right.
 3. What happens to atomic radii as you move down a column and across a row?

Gets smaller

Number of intervals	Largest interval
1	10
2	5
3	3.33
4	2.5
5	2
6	1.67
7	1.43
8	1.25
9	1.11
10	1

A 10x10 grid showing a path from the bottom-left corner to the top-right corner. The path is composed of 10 squares, each containing a black L-shaped piece. The last square in the path is circled in red.

- What happens to atomic radii as you move down a column and across a row? On the arrows on the diagram, indicate the trend. (Options: gets bigger OR gets smaller)
 - Of all the elements on the periodic table, identify & circle the largest & smallest in size.

5. Rank the following elements from largest to smallest in atomic radius.

6. How can you explain the trend?

- b) $\mathbb{U}_1 \cap \mathbb{F}_1 = \mathbb{U}_1 \cap \mathbb{B}_1$

5. Rank the following elements from largest to smallest in atomic radii:
 a) Be, Ba, Mg = Ba, Mg, Be b) Li, F, B = Li, B, F *not exact*

6. How can you explain the trend?
 a. Why do they get smaller as you go across a period? Additional protons in the nucleus "pull" on electrons, bring the electron cloud closer. **Effective nuclear charge, Z_{eff}**
 Increases the attraction of the nucleus and therefore pulls the electron cloud closer to the nucleus resulting in smaller radius
