

Membrane Function

How does the cell membrane control movement of materials?

Why?

The membrane is critical to the maintenance of homeostasis in living organisms. The cell membrane separates the cell from the external environment and plays a critical role in regulating movement of material in and out of the cell. Additionally, eukaryotic cells are made complex by the presence of internal membranes that form organelles, so the cells may become specialized. These organelle membranes create compartments within the cell that can do specific functions.

Biological Membranes Roger Harrison, 2013-11-22 to the Second Edition RESEARCH INTO MEMBRANE ASSOCIATED PHENOMENA HAS EXPANDED VERY greatly in the five years that have elapsed since the first edition of Biological Membranes was published It is to take account of rapid advances in the field that we have written the present edition There is now general acceptance of the fluid mosaic model of membrane structure and of the chemiosmotic interpretation of energetic processes and our attention has shifted from justifying these ideas to explaining membrane functions in their terms Much more information has become available concerning the role of the plasma membrane in the cell's recognition of and response to external signals and this is reflected in the increased coverage of these topics in the book The general form of the book remains the same As before a list of suggested reading sub divided by chapter is provided and this has been expanded to include a greater proportion of original papers The book is still primarily designed as an advanced undergraduate text and also to serve as an introduction for post graduate workers entering the field of membrane research We have taken cognizance of the comments of many reviewers colleagues and students on the first edition and thank them for their contributions In particular we wish to acknowledge our colleagues R Eisinger, G D Holman, D W Hough and A H Rose Dr C R

Control of Membrane Function: short-term and long-term J.M. Ritchie, P. Magistretti, L. Bolis, 2012-12-02 A critical factor in cell to cell interactions is the presence in the cell membrane of highly specific ion channels controlled by specific receptors that are bound to and activated by a gamut of external hormones and neurotransmitters Through both this action on ion channels and action on other membrane components such as G proteins extracellular signals alter intracellular events usually through the mediation of second messengers and so provide the basis for the transduction mechanism connecting extracellular signals with intracellular effectors This volume deals with the various ways that such membrane function is controlled

Molecular Biology of Membranes H.R. Petty, 2013-06-29 This text attempts to introduce the molecular biology of cell membranes to students and professionals of diverse backgrounds Although several membrane biology books are available they do not integrate recent knowledge gained using modern molecular tools with more traditional membrane topics Molecular techniques such as cDNA cloning and x ray diffraction have provided fresh insights into cell membrane structure and function The great excitement today which I attempt to convey in this book is that molecular details are beginning to merge with physiological responses In other words we are beginning to understand precisely how membranes work This textbook is appropriate for upper level undergraduate or beginning graduate students Readers should have previous or concurrent coursework in biochemistry prior studies in elementary physiology would be helpful I have found that the presentation of topics in this book is appropriate for students of biology biochemistry biophysics and physiology chemistry and medicine This book will be useful in courses focusing on membranes and as a supplementary text in biochemistry courses Professionals will also find this to be a useful resource book for their personal libraries

Exploring the Cell Membrane: Conceptual Developments A. Kleinzeller, 2012-12-02 The suggestion for this collection of essays originated in part from a course given to graduate students at the University of Pennsylvania School of Medicine In sections of this course the conceptual developments in the fields of membrane transport and cellular respiration were traced to illustrate general aspects of the development of ideas in a scientific field Discussions with peers on the topic also greatly enhanced the development of the project as it is reflected in this book The volume reflects the breadth and scope of this rapidly developing field and is an excellent treatise of a historical evaluation of how this field has developed

Papa, J.M. Tager, 2012-12-06 This book consists of a series of reviews on selected topics within the rapidly and vastly expanding field of membrane biology Its aim is to highlight the most significant and important advances that have been made in recent years in understanding the structure dynamics and functions of cell membranes Areas covered in this monograph include Signal Transduction Membrane Traffic Protein and Lipids Bioenergetics Energy Transfer and Membrane Transport Cellular Ion Homeostasis Growth Factors and Adhesion Molecules Structural Analysis of Membrane Proteins Membranes and Disease Biochemistry of Cell Membranes should serve as a benchmark for indicating the most important lines for future research in these areas **Membrane Structure and Function** Richard D. The Plant Plasma Membrane Christer Larsson, Ian M. Møller, 2012-12-06 The plasma membrane forms the living barrier between the cell and its surroundings For this reason it has a wide range of important functions related to the regulation of the composition of the cell interior and to communication with the cell exterior The plasma membrane has therefore attracted a lot of research interest Until the early 1970 s it was only possible to study the plasma membrane in situ its structure e g by electron microscopy and its function e g by uptake of radioactively labeled compounds into the intact cell or tissue The first isolation of plant protoplasts by enzymatic digestion of the cell wall in the early 1970 s was an important step forward in that it provided direct access to the outer surface of the plasma membrane More importantly T K Hodges and R J Leonard in 1972 published the description of a method by which a fraction enriched in plasma membranes could be isolated from plant tissues using sucrose gradient centrifugation As a result the 1970 s saw a leap forward in our understanding of the structure and function of the plasma membrane In 1981 S Widell and C Larsson published the first of a series of papers in which plasma membrane vesicles of high yield and purity were isolated from a wide range of plant tissues using aqueous polymer two phase partitioning *Membrane Function* Douglas Sawyer, 1995
