

POGIL Bacteria Around Campus

by Elena Higuchi

What are the different characteristics and modes of transmission for bacteria at Northwood High School?

Why?

It is commonly understood that schools are known for festering hotbeds of bacteria that can spread a cold as quickly as a wildfire. Bacteria thrive in warm, moist and protein-rich environments. Although one may think the only wet and warm environment on campus are the toilet seats in the bathroom, bacteria lurk in many unsuspecting places at Northwood.

Model 1 — Bacteria Samples from Random Locations on Campus

The moist teardrop from the individual math test Student A took this morning:

This malicious bacteria (*D. Doomgradescocci*) preys on the tears of young high school students to extract the scrumptious flavor of hopelessness and doom. It can live for up to 34 class periods on surfaces, be transmitted through objects like cardboard offices and eraser shavings, as well as airborne mechanisms such as the pesky "What did you get?" cough.

Food residue from an English class that hosts a club meeting during lunch:

Lunchresidueo Snicker lingers within the mysterious streaks on the desk which papers stick to. Symptoms include nausea, absentee syndrome (a strong desire to skip school), and abnormal movement away from one's usual seat. Note: symptoms may be easily confused with another budding plague: 'senioritis', but viral infections manifest much differently than bacteria.

The dark staircase crawlers in the 1200s building:

Mytereeckorner has been through it all—breakups, friends eating lunch together and hundreds of kids walking through each day—and it'll always be there, festering in the puddle that doesn't ever seem to dry up. Especially dangerous because of standing water and freshmen seem to be at a 25% higher risk than other grades.

1. Consider the bacteria samples illustrated in Model 1.

Which building is *D. Doomgradescocci* most likely to be found?

Why are freshmen more likely to be at risk for *Mytereeckorner*?

What compound is necessary for *D. Doomgradescocci* to survive?
