

Worksheet – Calorimetry

Calorimetry is the experimental measurement of heat (q) produced in chemical and physical processes. Heat can not be measured directly, but temperature changes can be measured. The factor that links these two is **heat capacity**.

Heat capacity, C , is defined as the heat required to raise the temperature of a substance one degree. It relates a measured change in temperature (ΔT) to heat flow (q) by the equation:

$$q = C \times \Delta T \times \text{mass}$$

This can be calculated on a per gram basis (specific heat capacity) or a per mole basis (molar heat capacity).

It is easiest to understand the molecular basis for heat capacity by using molar heat capacities of different substances. As energy enters a system, it is distributed among all of the degrees of freedom within a molecule (translational, rotational and vibrational modes). The more complex the molecule, the larger its heat capacity, and the smaller the rise in temperature, since the energy is spread out among more modes.

1. 10 gram samples of iron at a temperature of 100°C are placed into three beakers each containing 1.0 mol of three different solvents, octane, trichloromethane and methanol, all at 25.0°C . Their structures and molar masses are shown below.

octane C_8H_{18}
($\text{mw} = 114 \text{ g/mol}$)

trichloromethane CHCl_3
($\text{mw} = 119 \text{ g/mol}$)

methanol CH_3OH
($\text{mw} = 32 \text{ g/mol}$)

- How many degrees of freedom in each compound? $3 \times n$ $n = \# \text{ atoms}$
octane $26 \times 3 = 78$ trichloromethane $3 \times 5 = 15$ methanol $3 \times 6 = 18$
- Which will have the largest molar heat capacity? *most modes - octane*
- This compound have the (*largest*, smallest) change in temperature.
- Which will have the largest change in temperature? *smallest C = trichloro methane*
- The temperature of the methanol rises to 28.9°C . The specific heat capacity of iron is $0.449 \text{ J/g}^\circ\text{C}$. What are the **specific and molar heat capacities** of methanol?
 $q_{\text{metal}} = -q_{\text{solvent}}$ $1 \text{ mol} = 32 \text{ g}$

$$\begin{aligned}
 (0.449 \text{ J/g}^\circ\text{C})(10 \text{ g})(28.9 - 100) &= -(C)(32 \text{ g})(28.9 - 25) \\
 C &= \frac{2.56 \text{ J}}{\text{g}^\circ\text{C}} \times \frac{32 \text{ g}}{\text{mol}} = 81.9 \text{ J/mol}^\circ\text{C}
 \end{aligned}$$

Principles of Thermal Analysis and Calorimetry Simon Gaisford, Vicky Kett, Peter Haines, 2019-03-15 The use of thermal and calorimetric methods has shown rapid growth over the past few decades in an increasingly wide range of applications The original text was published in 2001 since then there have been significant advances in various analytical techniques and their applications This second edition supplies an up to date concise and readable account of the principles experimental apparatus and practical procedures used in thermal analysis and calorimetric methods of analysis Written by experts in their field brief accounts of the basic theory are reinforced with detailed technical advances and contemporary developments Where appropriate applications are used to highlight particular operating principles or methods of interpretation As an important source of information for many levels of readership in a variety of areas this book will be an aid for students and lecturers through to industrial and laboratory staff and consultants **Animal and Human Calorimetry** J. A. McLean, G. Tobin, 1987 This volume provides a comprehensive survey of the theory practice and techniques of calorimetry as applied to the study of energy metabolism in humans and animals Calorimetry is used to estimate nutritional requirements of man and farm livestock and to evaluate different foods It is also a powerful tool used in research into fundamental nutritional and physiological life processes and in the evaluation of stresses imposed by abnormal or severe environments It is currently being applied in various branches of medical research and can be used as a diagnostic tool in hospitals for investigation of metabolic disorders The authors discuss both direct calorimetry which measures heat loss directly and indirect calorimetry where heat loss is inferred by measurement of some of the chemical byproducts of metabolism In addition guidance is provided to the instrumentation technical problems and precautions necessary to obtain accurate calorimetric measurements Standard Test Method for Determining Specific Heat Capacity by Sinusoidal Modulated Temperature Differential Scanning Calorimetry, *Laboratory Notes on Heat Measurements* Charles L. Norton, 1903 *Handbook of Thermal Analysis and Calorimetry* Michael E. Brown, 1998-09-07 Handbook of Thermal Analysis and Calorimetry Volume 1 Principles and Practice describes the basic background information common to thermal analysis and calorimetry in general Thermodynamic and kinetic principles are discussed along with the instrumentation and methodology associated with thermoanalytical and calorimetric techniques The purpose is to collect the discussion of these general principles and minimize redundancies in the subsequent volumes that are concerned with the applications of these principles and methods More unique methods which pertain to specific processes or materials are covered in later volumes

Longitudinal Heat Flow Calorimetry A. Antriasian, G. Beardsmore, 2014 We present a method for measuring the heat capacity of a rock specimen using a divided bar apparatus in a transient mode The specific heat capacity can be derived if the

mass of the specimen is known Thermal conductivity can be measured during a steady state phase of the measurement process and longitudinal thermal diffusivity can also be derived if the specimen volume and hence density is measured A divided bar delivers a longitudinal flow of heat through a rock specimen and is conventionally used only in a steady state mode for thermal conductivity measurements Our method employs a time series record of temperature changes at four points along the divided bar assembly to compare the net thermal energy absorbed by a specimen to its change in temperature during thermal re equilibration from one steady state temperature to another The technique is calibrated using a set of analytical standards of known heat capacity Our method yields mean values of specific heat capacity within 1 % of published values for cultured quartz Repeated measurements on the same specimens also give consistent results within approximately 1 % A combined thermal conductivity and heat capacity measurement takes less than one hour per specimen Our method can be replicated with any divided bar apparatus employing a precise electronic temperature control system capable of switching between two steady state mean temperatures along with a digital data logging system capable of recording and displaying data at a rate of one record per second Analytical Calorimetry Roger Stephen Porter, Julian Frank Johnson, 1977 A convection-scope & calorimeter Alfred Rosling Bennett, 1897 *Handbook of Thermal Analysis and Calorimetry* Richard B. Kemp, 1999-12-13 The applications and interest in thermal analysis and calorimetry have grown enormously during the last half of the 20th century These techniques have become indispensable in the study of processes such as catalysis hazards evaluation etc and in measuring important physical properties quickly conveniently and with markedly improved accuracy Consequently thermal analysis and calorimetry have grown in stature and more scientists and engineers have become at least part time practitioners People new to the field therefore need a source of information describing the basic principles and current state of the art The last volume of this 4 volume handbook devoted to many aspects of biological thermal analysis and calorimetry completes a comprehensive review of this important area All chapters have been prepared by recognized experts in their respective fields The approach taken is how and what to do and when to do it The complete work is a valuable addition to the already existing literature Calorimetry Frank H.
