Electron-Phonon Interactions and Phase Transitions T. Riste, 2013-03-09 This NATO Advanced Study Institute was the fourth in a series devoted to the subject of phase transitions and instabilities with particular attention to structural phase transformations Beginning with the first Geilo institute in 19 1 we have seen the emphasis evolve from the simple quasiharmonic soft mode description within the Landau theory through the unexpected spectral structure represented by the central peak 1973 to such subjects as melting turbulence and hydrodynamic instabilities 1975 Sophisticated theoretical techniques such as scaling laws and renormalization group theory developed over the same period have brought to this wide range of subjects a pleasing unity These institutes have been instrumental in placing structural transformations clearly in the mainstream of statistical physics and critical phenomena The present Geilo institute retains some of the counter cultural flavour of the first one by insisting whenever possible upon peeking under the skirts of even the most successful phenomenology to catch a glimpse of the underlying microscopic processes Of course the soft mode remains a useful concept but the major emphasis of this institute is the microscopic cause of the mode softening The discussions given here illustrate that for certain important classes of solids the cause lies in the electron phonon interaction Three major types of structural transitions are considered In the case of metals and semimetals the electron phonon interaction relies heavily on the topology of the Fermi surface **Intelligent Information and Database Systems** Ngoc Thanh Nguyen, Ford Lumban
