Flow and Transformations in Porous Media Renaud
Toussaint,Bjørnar Sandnes,Daniel Koehn,Piotr Szymczak,Einat Aharonov,2017-02-07 Fluid flow in transforming porous rocks
fracture networks and granular media is a very active interdisciplinary research subject in Physics Earth Sciences and
Engineering Examples of natural and engineered processes include hydrocarbon recovery carbon dioxide geo sequestration
soil drying and wetting pollution remediation soil liquefaction landslides dynamics of wet or dry granular media dynamics of
faulting or friction volcanic eruptions gas venting in sediments karst development and speleogenesis ore deposit
development and radioactive waste disposal Hydrodynamic flow instabilities and pore scale disorder typically result in
complex flow patterning In transforming media additional mechanisms come into play compaction de compaction erosion
segregation and fracturing lead to changes in permeability over time Dissolution precipitation and chemical reactions
between solutes and solids may gradually alter the composition and structure of the solid matrix either creating or destroying
permeable paths for fluid flow A complex dynamic feedback thus arises where on the one hand the fluid flow affects the
characteristics of the porous medium and on the other hand the changing medium influences the fluid flow This Research
Topic Ebook presents current research illustrating the depth and breadth of ongoing work in the field of flow and
transformation in porous media through 15 papers by 72 authors from around the world The body of work highlights the
challenges posed by the vast range of length and time scales over which subsurface flow processes occur Importantly
phenomena from each scale contribute to the larger scale behavior The flow of oil and gas in reservoirs and the flow of
groundwater on catchment scale is sensitively linked to pore scale processes and material heterogeneity down to the
micrometer scale The geological features of the same reservoirs and catchments evolved over millions of years sometimes as
a consequence of cracking and fracture growth occurring on the time scale of microseconds The research presented by the
authors of this Research Topic represents a step toward bridging the separation of scales as well as the separation of
scientific disciplines so that a more unified picture of flow and transformation in porous media can start to emerge
